Synchrotron Radiation Techniques in Industrial, Chemical, and Materials Science Kevin L. D'Amico, Louis J. Terminello, David K. Shuh, 2012-12-06 The individual papers that comprise this monograph are derived from two American Chemical Society ACS Fall National Meetings that focused on the current uses of synchrotron radiation SR research techniques The first Symposium was held in Washington DC in August 1994 and the second convened in Chicago IL in August 1995 The intent of these symposia was to present a broad overview of several current topics in industrial chemical and materials based SR research to a chemically inclined audience The SR techniques covered were divided roughly into the three general fields of industrial chemical and materials science for this purpose Included within these four categories are environmental geologic atomic molecular analytical solid state physics surface science and biological applications of SR There is little doubt that structural biology and environmental science are the largest growth areas in SR research as this monograph goes to press The spirit of these symposia was to bring together the expert synchrotron radiation user with new and potential users of SR techniques There are now a preponderance of particle storage rings located throughout the world devoted exclusively to the production of SR There have been great improvements in the particle accelerators and storage rings from which SR emanates These newest third generation SR sources are the result of the successful collaboration between SR users and accelerator physicists which has made a reality out of experiments never before possible

Applications of Synchrotron Light to Scattering and Diffraction in Materials and Life Sciences T.A. Ezquerra, Mari Cruz Garcia-Gutierrez, Aurora Nogales, Marian Gomez, 2009-06-15 In a first approximation certainly rough one can define as non crystalline materials those which are neither single crystals nor polycrystals Within this category we can include disordered solids soft condensed matter and living systems among others Contrary to crystals non crystalline materials have in common that their intrinsic structures cannot be exclusively described by a discrete and periodical function but by a continuous function with short range of order Structurally these systems have in common the relevance of length scales between those defined by the atomic and the macroscopic scale In a simple fluid for example mobile molecules may freely exchange their positions so that their new positions are permutations of their old ones By contrast in a complex fluid large groups of molecules may be interconnected so that the permutation freedom within the group is lost while the permutation between the groups is possible In this case the dominant characteristic length which may define the properties of the system is not the molecular size but that of the groups A central aspect of some non crystalline materials is that they may self organize This is of particular importance for soft matter materials Self organization is characterized by the spontaneous creation of regular structures at different length scales which may exhibit a certain hierarchy that controls the properties of the system X ray scattering and diffraction have been for more than a hundred years an essential technique to characterize the structure of materials Quite often scattering and diffraction phenomena exhibited by non crystalline materials have been referred to as non crystalline diffraction
