Chemical Evolution From Zero To High Redshift:

Chemical Evolution from Zero to High Redshift Jeremy Walsh, Michael R. Rosa, 2013-06-29 New Quests in Stellar Astrophysics: The Link Between Stars and Cosmology Miguel Chávez, Alessandro Bressan, Alberto Buzzoni, Divakara Mayya, 2012-12-06 Stellar astrophysics still provides the basic framework for deciphering the imprints left over by the evolving universe on all scales. Advances or shortcomings in the former field have direct consequences in our ability to understand the global properties of the latter. This volume contains the most recent updates on a variety of topics that though independent by themselves are inevitably connected on a cosmological scale. These include comprehensive articles by leaders in fields extending from stellar atmospheres through properties of the stellar component in the Milky Way up to the stellar environment in high redshift galaxies. The wide coverage of astrophysical themes makes this volume very valuable for researchers and Ph D students in astrophysics.

Chemical Abundances in the Universe (IAU S265) International Astronomical Union. Symposium, 2010-03-25 IAU Symposium 265 presents a unified picture of nucleosynthesis, the production of chemical elements over cosmic time. It explains how this chemical evolution links together the early Universe of the first stars through the formation of galaxies and their diverse populations of stars to a Universe of heavy element rich stars and planets. The first generation of massive stars that drove reionization left their chemical signatures imprinted in the oldest low mass stars which we observe today. Chemical evolution is a broad, diverse and rapidly evolving field due to the ever expanding capabilities delivered by new arrays of instruments on large telescopes together with significant advances in modelling and increasing access to large and accurate nuclear atomic and molecular databases. Written for researchers and graduate students, the topics covered in this volume provide a comprehensive overview of the scientific progress achieved in recent years.

The Mass of Galaxies at Low and High Redshift Ralf Bender, 2003-01-23 Measuring the masses of galaxies as a function of redshift is perhaps one of the most challenging open issues in current astronomical research. The evolution of the baryonic and dark matter components of galaxies is not only a critical test of the hierarchical formation paradigm but ultimately also provides new clues on the complex interplay between star formation, the cooling and heating of gas and galaxy merging processes. This book reviews current techniques to measure the baryonic stellar and dark masses of nearby galaxies and focusses on ongoing attempts to measure these same quantities in galaxies at higher and higher redshifts. It also gives room to future perspectives with special emphasis on new survey projects and satellite missions.

Theoretical and Observational Cosmology Marc Lachièze-Rey, 2012-12-06 A complete account of the fundamental techniques of general relativity and their application to cosmology. The book includes reviews of the different cosmological models and their classification including such topics as causality and horizons, the cosmological parameters, observational tests and constraints of cosmology, symmetries and the large scale topology of space and space time and the use of supernovas as cosmological indicators. The perturbations to the cosmological models are discussed throughout the volume. The cosmic microwave

background is presented with an emphasis in secondary distortions in relation to cosmological models and large scale structures Recent results on dark matter are summarised A general review of primordial nucleosynthesis is given Gravitational lensing is discussed in great detail Most contributions show a balance between theory and observation Readership A solid background for students and researchers intending to work in the field of theoretical and observational cosmology

Galaxy Disks and Disk Galaxies José G. Funes, Enrico Maria Corsini, 2001 Annotation Proceedings of a meeting sponsored by the Vatican Observatory and held at Pontifical Gregorian U Rome in June 2000 The conference included some 230 participants from 30 countries and covered topics related to the structure formation and evolution of galaxies with disks Topics include the stellar and gaseous disk of the Milky Way the global characteristics of galaxy disks their structure morphology and dynamics the gaseous components star formation and chemical evolution the interactions accretions mergers and starbursts the dark and luminous matter the establishment of the scaling laws and the formation and evolution of disk galaxies from theoretical and observational points of view Annotation c Book News Inc Portland OR booknews.com
