## **Development Of The Vertebrate Retina:**

*Development of the Vertebrate Retina* Barbara L. Finlay, Dale R. Sengelaub, 2013-03-08 The vertebrate retina has a form that is closely and clearly linked to its function. Though its fundamental cellular architecture is conserved across vertebrates, the retinas of individual species show variations that are also of clear and direct functional utility. Its accessibility, readily identifiable neuronal types and specialized neuronal connectivity and morphology have made it a model system for researchers interested in the general questions of the genetic, molecular and developmental control of cell type and shape. Thus the questions asked of the retina span virtually every domain of neuroscientific inquiry: molecular, genetic, developmental, behavioral and evolutionary. Nowhere have the interactions of these levels of analysis been more apparent and borne more fruit than in the last several years of study of the development of the vertebrate retina. Fields of investigation have a natural evolution, moving through periods of initial excitement, of framing of questions and controversy to periods of synthesis and restatement of questions. The study of the development of the vertebrate retina appeared to us to have reached such a point of synthesis. Descriptive questions of how neurons are generated and deployed and questions of mechanism about the factors that control the retinal neuron's type and distribution and the conformation of its processes have been posed and in good part answered. Moreover, the integration of cellular accounts of development with genetic, molecular and whole eye and behavioral accounts has begun.

**The Development of the Vertebrate Retina** G. Grün, 2012-12-06 The mature vertebrate retina is a highly complicated array of several kinds of cells capable of receiving light impulses, transforming them into neuronal membrane currents and transmitting these in a meaningful way to central processing. Before it starts to develop it is a small sheet of unobtrusive cells which do not differ from other cells of the central nervous system. The chain of events which lead to the transformation from this stage into that of highly specialized cells ready to fulfill a specific task is usually called differentiation. Originally this word indicated firstly the process of divergence from other cells which were previously alike and secondly the change from an earlier stage of the same cell. It has become widespread practice to imply by the word differentiation also the acquisition of specific properties and capacities which are characteristic of a mature, specifically active cell. Every cell is active at any stage of development but certain activities are shared by most cells, e.g. the activities of preparing and accomplishing proliferation, that of initiating development, that of maintaining a certain level of metabolism while there are others which are shared by only a small number of originally related cells. In most cases these latter activities are acquired by the final steps of cellular development, the terminal differentiation. In the context of the present paper the word function will refer to this latter type of specific activity.

**Development, structure and function of vertebrate retinas: A virtual festschrift for Prof. Steve Massey** David W. Marshak, Judith

Mosinger Ogilvie, Chai-An Mao, Christophe P. Ribelayga, 2024-09-19 This is a remarkable time to study the vertebrate retina either as a model for the brain or to understand the first steps in vision. We have known about the diversity of retinal neurons and glia for more than one hundred years and we are now extending these findings and making new discoveries about retinal cell types by analyzing gene expression in single cells. We have made significant progress toward our ultimate goals of describing the neural circuits in the retinas at the level of connections between identified populations of neurons and understanding neuronal and glial cell function at the molecular level. We have also made great strides toward understanding retinal development and the etiology of retinal diseases. Physiologists are now using more realistic stimuli and modern analytical methods to analyze the mechanisms underlying light responses of retinal neurons and this has led to more accurate computational models of neural circuits in the retina. My colleague at the McGovern Medical School in Houston, Steve Massey, has made many important contributions to this field both as a researcher and as a mentor and he is planning his retirement. Judith Ogilvie, Christophe Ribelayga, Chai-an Mao, and I will dedicate this issue to him and plan to publish some of his latest work. This Research Topic will include mini reviews and brief communications about neurons and neural circuits in vertebrate retinas. The scope will be very broad including anatomical, physiological, psychophysical, and computational approaches to this topic. Potential topics include but are not restricted to: Development, morphology, and synaptic connections of neuronal types; Light responses, spontaneous activity, and membrane properties of retinal neurons; Gene expression and other aspects of cell biology of identified retinal neurons; Release of neurotransmitters and modulators and their effects in the retina; Structure and function of electrical synapses in the retina; Neural circuits that mediate responses to color contrast and movement; Roles of neuroglia in retinal development, homeostasis, and light responses; Contributions of neural circuits in the retina to visual perception; Evolution of neuronal types and neural circuits in the retina; Novel techniques for analyzing retinal neurons and neural circuits; Non-invasive methods to analyze retinal structure and function; Etiology of retinal diseases and potential new therapies; Directions for future research on the vertebrate retina.

#### **Vertebrate Eye Development** M.

Elizabeth Fini, 2012-09-07 Who would believe that so small a space could contain the images of all the universe? Leonardo da Vinci. The last years of the 20th century have found the discipline of Developmental Biology returning to its original position at the forefront of biological research. This progress can be attributed to the burgeoning knowledge base on molecules and gene families and to the power of the molecular genetic approach. Topping the list of organ systems which have provided the most significant advances would have to be the eye. The vertebrate eye was one of the classic embryologic models used to demonstrate many important principles including the concepts of inductive tissue interactions first put forth in the early 1900s. Within the last decade of this century a return to some of the old questions with the new approaches has put eye development back into the limelight. I find this a highly appropriate topic for a book which aims to spark research for the new millennium. We begin with a chapter that discusses the anatomy of eye development providing the basic reference

information for the chapters that follow A novel aspect of this introduction is the connection made between developmental strategies and the eye's optical function What also emerges from this chapter is the number of important eye structures that have barely been touched by the modern developmental biologist Work on cornea and anterior chamber development has lagged behind lens and retina

**The Origin of the Lateral Eyes of Vertebrates** George Howard Parker, 1908 Retinal Development Evelyne Sernagor, Stephen Eglen, Bill Harris, Rachel Wong, 2012-11-29 This advanced text first published in 2006 takes a developmental approach to the presentation of our understanding of how vertebrates construct a retina Written by experts in the field each of the seventeen chapters covers a specific step in the process focusing on the underlying molecular cellular and physiological mechanisms There is also a special section on emerging technologies including genomics zebrafish genetics and stem cell biology that are starting to yield important insights into retinal development Primarily aimed at professionals both biologists and clinicians working with the retina this book provides a concise view of vertebrate retinal development Since the retina is an approachable part of the brain this book will also be attractive to all neuroscientists interested in development as processes required to build this exquisitely organized system are ultimately relevant to all other parts of the central nervous system

**Discussion of the Origin of Vertebrates, January 20 and February 3, 1910** Walter Holbrook Gaskell, 1910 *Proceedings of the Linnean Society of London* Linnean Society of London, 1907 Includes list of additions to the library

**Development and Regeneration of Neuronal Circuits in the Vertebrate Retina** Florence D. D'Orazi, 2016 Like in other parts of the central nervous system CNS information processing in the retina depends upon the exquisite organization of synaptic connectivity amongst diverse neuronal cell types Assembly of neuronal circuits during retinal development is highly orchestrated Recapitulating the precision of this process presents a major challenge for therapeutic efforts to repair the retina after injury or disease in mammals Whereas mammals cannot replenish lost neurons in their retinas zebrafish show an innate ability to regenerate their retinas In this work I sought to advance our understanding of the restorative potential of retinal regeneration I capitalized on the native regenerative capacity of the zebrafish to provide some of the first insights into the fidelity of neuronal replacement and integration in the retina In Chapter 1 I review the factors and mechanisms that shape organized circuitry during retinal development as well as summarize the current state of the field in teleost and mammalian retinal regeneration research In Chapters 2 and 3 I investigate bipolar cells interneurons that convey light signals from photoreceptors to the retinal output neurons In Chapter 2 I explore the cellular strategies that functionally distinct bipolar cell types undertake during retinal development to attain their characteristic morphologies and dendritic wiring patterns I use this knowledge in Chapter 3 as a framework to assess the ability of regenerated circuits to engage developmental mechanisms to re-establish their original patterning I utilize a genetically targeted cell ablation technique to trigger regeneration of bipolar cells in situ and investigate the precision with which regenerated cells integrate into a mature retinal network In Chapter 4 I examine the specificity of endogenous

neuronal replacement by comparing the composition of regenerated cone photoreceptor populations after ablation of distinct cone types Lastly in Chapter 5 I summarize my findings and discuss future directions to address questions raised by this work
