**Abstract.** To somewhat broaden the scope covered in companion papers of this special issue, which covers fracture research currently being reported in Greece, the author has briefly reviewed associated developments in the region, although rather than being comprehensive, it reflects mainly his own interests. Topics covered include: new trends in the optical method of caustics, kinking and temperature distribution in dynamic crack problems, fatigue crack growth studies, partially bonded inclusions in elastic media, local and global instability in cracked bodies, fracture behavior of composite materials and transient elastodynamic problems.

### 1. Introduction

Research in the mechanics of fracture has been pioneered in Greece by Professor Theocaris and his research group at Athens National Technical University since the late sixties. Problems studied included evaluation of stress intensity factors in cracked bodies by experimental, theoretical and numerical methods under static and dynamic loading. Particular attention was given to the development of the optical method of caustics. The method was applied to a vast number of problems of engineering interest, including determination of stress intensity and concentration factors in single cracks in isotropic and anisotropic media, arrays of cracks, branched cracks, cracks along interfaces, cracked plates and shells, notches, inclusions, elastoplastic crack problems, contact problems, dynamic crack problems, etc. [1]. For a survey of experimental fracture mechanics activities in Greece until the early eighties, refer to [2]. Since then, fracture mechanics research has proliferated in most of the six national technical universities of Greece. Besides universities, a number of industrial and research institutions are active, mainly, in technological research and industrial applications of fracture mechanics. Among them, the Hellenic Aerospace Industry plays a leading role in fracture mechanics applications including the use of nondestructive testing methods for the detection, positioning and sizing of defects in civilian and military aircraft. Methods include dye penetrant, magnetic particles, eddy currents, radiography, ultrasonics and acoustic emission. Furthermore, research in the composite patch repair of metallic aircraft structures is underway. In addition, there have been efforts to improve teaching in the fracture courses, offered mainly at the graduate level, in most technical universities. It is also appropriate to cite a few of the international handbooks which have been used [3–6]. Publication of articles in international journals and conference proceedings by Greek authors related to fracture mechanics has mushroomed during the last three decades. Furthermore, in all four Greek National Congresses on Mechanics held in 1986, 1989, 1992 and 1995, special sessions devoted to fracture mechanics have been included. It is fitting to refer to the two international conferences related to fracture mechanics held in Athens in 1980 [7] and in Xanthi in 1989 [8].

The objective of the present communication is to present a brief review of the major recent research activities in Greece related to fracture mechanics. Problems include: new trends in the
