**Characterization and Failure Analysis of Plastics** ASM International, Steve Lampman, 2003-01-01 The selection and application of engineered materials is an integrated process that requires an understanding of the interaction between materials properties manufacturing characteristics design considerations and the total life cycle of the product This reference book on engineering plastics provides practical and comprehensive coverage on how the performance of plastics is characterized during design property testing and failure analysis The fundamental structure and properties of plastics are reviewed for general reference and detailed articles describe the important design factors properties and failure mechanisms of plastics The effects of composition processing and structure are detailed in articles on the physical chemical thermal and mechanical properties Other articles cover failure mechanisms such as crazing and fracture impact loading fatigue failure wear failures moisture related failure organic chemical related failure photolytic degradation and microbial degradation Characterization of plastics in failure analysis is described with additional articles on analysis of structure surface analysis and fractography Developments in Polymer Characterization J. McCauley, Volker Weiss, 2013-03-13 The Sagamore Army Materials Research Conferences have been held in the beautiful Adirondack Mountains of New York State since 1954 Organized and conducted by the Army Materials and Mechanics Research Center Watertown Massachusetts in cooperation with Syracuse University the Conferences have focused on key issues in Materials Science and Engineering that impact directly on current or future Army problem areas A select group of speakers and attendees are assembled from academia industry and other parts of the Department of Defense and Government to provide

an optimum forum for a full dialogue on the selected topic This book is a collection of the full manuscripts of the formal presentations given at the Conference The emergence and use of nontraditional materials and the excessive failures and reject rates of high technology materials intensive engineering systems necessitates a new approach to quality control Thus the theme of this year's Thirty First Conference Materials Characterization for Systems Performance and Reliability was selected to focus on the need and mechanisms to transition from defect interrogation of materials after production to utilization of materials characterization during manufacturing The guidance and help of the steering committee and the dedicated and conscientious efforts of Ms Karen Ka100stian Conference Coordinator and Mr William K Wilson and Ms Mary Ann Holmquist are gratefully acknowledged The continued active interest and support of Dr Edward S Wright Director AMMRC Dr Robert W Lewis Associate Director AMMRC and COL L C Ross Commander Deputy Director AMMRC are greatly appreciated

**Developments in Polymer Characterisation—4** J.V. Dawkins, 2012-12-06 This volume includes reviews on tackling polymer characterisation problems and on developing specific characterisation techniques The first two chapters and the last chapter describe progress in providing characterisation information for polymers containing long chain branching for polymer blends and for polymers having preferred

orientation The remaining chapters review progress in individual techniques showing with examples the characterisation results which may be obtained It is recognised that the degree of chain branching which can evolve in some polymerisation processes can have a marked effect on the flow properties of a polymer and therefore on polymer processing behaviour In the first chapter the characterisation of long chain branching from measurements of the molecular size and molar mass of a polymer in dilute solution is outlined It is indicated that a complete characterisation of branching requires the combined use of several techniques emphasising in particular recent developments involving gel permeation chromatography Thermal analysis and infrared spectroscopy are widely used techniques in polymer characterisation Both techniques can provide very quickly significant results with readily available instrumentation This is illustrated by the review of the characterisation of polymer blends by thermal analysis in Chapter 2 An assessment of blend morphology which influences the behaviour of a material consisting of two or more polymers is presented in terms of transition temperatures Conventional infrared spectroscopy involves dispersive spectrometers which do not always provide accurate information on composition and structure for complex polymeric materials
