## **Developments In Lymphoid Cell Biology:**

**Developments in Lymphoid Cell Biology** A. Arthur Gottlieb, 2018-01-18 In this volume the author by no means attempted to give a comprehensive view of the myriad of recent developments in immunology The author has attempted after introducing sufficient background in chapter 1 to highlight certain areas of lymphoid cell biology which are given less attention in current thinking but which seem to the author to offer exciting prospects for research In other cases the important topics of transplantation and tolerance are looked at from points of view which are somewhat less conventional in the hope that these aspects may stimulate others to look at the yet unsolved problems in these areas In making the selection of topics and indeed in the selection of references within each chapter the contributors and the author have attempted to select those which offered what seemed to be the best sources of information They do not wish to minimize the important contributions of others but are guided by constraints of brevity and cogent expression

**Innate Lymphoid Cell Development, Migration, and Function** Paula Licona-Limón, Jorge Henao-Mejia, José Carlos Crispín, 2023-10-23 Cell lineages derived from common lymphoid progenitors CLPs play a critical role in antigen recognition acute and long term protection against pathogens and maintenance of immune homeostasis CLPs give rise to adaptive immune cells that bear unique antigen receptors and to innate immune cells that perform non redundant roles particularly during early effector responses by facilitating local immunity and shaping the ensuing adaptive response Recent discoveries indicate that innate lymphoid cells ILCs exert essential modulatory effects in normal and pathological responses Because adaptive and innate lymphoid cells share transcription factors cytokines and molecular surface markers it is essential to dissect the contribution of innate lymphoid cell subsets to immune tolerance maintenance of tissue homeostasis and during the development of inflammatory responses In this research topic we will focus on the functional diversity and individual roles that the variety of innate lymphoid cell subsets perform in steady state as well as in different pathological conditions including infection and autoimmunity This will contribute to the generation of a more comprehensive and integrated view of how these cells interact with the environment collaborate with other cells and regulate tissue homeostasis and immunity in a context dependent manner We welcome Original Research Review and Mini review articles related to but not limited to the following topics 1 Innate lymphoid cell development and migration 2 Characterization and identification of signals controlling innate lymphoid differentiation and function 3 Molecular interactions between innate lymphoid cells and other immune and non immune subsets 4 Role of ILCs in tissue homeostasis 5 Role of ILCs in pathology We acknowledge the initiation and support of this Research Topic by the International Union of Immunological Societies IUIS We hereby state publicly that the IUIS has had no editorial input in articles included in this Research Topic thus ensuring that all aspects of this Research Topic are evaluated objectively unbiased by any specific policy or opinion of the IUIS

**Human Innate Lymphoid Cell Biology and Development** Luxi Chen, 2019 Based on these data we hypothesized that in humans all ILCs share a common developmental

pathway in tonsils and that at some point each ILC subset terminally differentiates along its own developmental trajectory Here we elucidated key steps of NK cell ILC2 and ILC3 development within human tonsils using ex vivo molecular transcriptional and functional profiling and lineage differentiation assays We demonstrated that while tonsillar NK cells ILC2s and ILC3s originate from a common ILC precursor cell identified as CD34 CD117 final steps of ILC2 development deviate independently and become mutually exclusive from those of NK cells and ILC3s whose developmental pathways overlap Moreover we discovered a CD34 CD117 ILC precursor population that expresses CD56 and gives rise to NK cells and ILC3s but not to ILC2s Collectively our data support a comprehensive model for human ILC development in tonsils advancing our understanding of basic ILC biology within the human immune system Importantly elucidating these fundamental developmental pathways have enabled us to gain greater insight into how cancer cells can disrupt ILC development and function to further disease progression

NK Cell Subsets in Health and Disease: New Developments Emanuela Marcenaro, Luigi D. Notarangelo, Jordan S. Orange, Eric Vivier, 2017-11-29 Natural Killer NK cells were discovered ca 1975 as the first group of lymphoid cells that were neither T cells nor B cells Since then the dissection of the biology of NK cells has been growing exponentially with many seminal discoveries from the identification of MHC class I specific inhibitory receptors to the discovery of receptor ligand pairs involved in NK cell activation and to the manipulation of NK cells in cancer In this research topic we asked a group of thought leaders in NK cell biology to review recent advances in their origins and biology and their roles in cancer infection and inflammation Together these 25 articles provide a timely survey of NK cells as critical immunologic components of health and disease They will hopefully prompt further dialogue and developments in basic and translational immunology

Recent Advances in  $\gamma\delta$  T Cell Biology: New Ligands, New Functions, and New Translational Perspectives Dieter Kabelitz, Julie Dechanet-Merville, 2016-02-16 Gamma delta T cells are a small subset of T lymphocytes in the peripheral circulation but constitute a major T cell population at other anatomical localizations such as the epithelial tissues In contrast to conventional T cells the available number of germline genes coding for T cell receptor TCR variable elements of T cells is very small Moreover there is a preferential localization of T cells expressing given Vgamma and Vdelta genes in certain tissues In humans T cells expressing the Vg9Vd2 encoded TCR account for anywhere between 50 and 95% of peripheral blood T cells whereas cells expressing non Vd2 genes dominate in mucosal tissues In mice there is an ordered appearance of T cell waves during embryonic development resulting in preferential localization of T cells expressing distinct VgammaVdelta genes in the skin the reproductive organs or gut epithelia The major function of T cells resides in local immunosurveillance and immune defense against infection and malignancy This is supported by the identification of ligands that are selectively recognized by the TCR As an example human Vgamma9Vdelta2 T cells recognize phosphorylated metabolites phosphoantigens that are secreted by many pathogens but can also be overproduced by tumor cells providing a basis for a role of these T cells in both anti infective and anti tumor immunity Similarly the recognition of endothelial protein

C receptor by human non Vdelta2 T cells has recently been identified to provide a link for the role for such T cells in immunity against epithelial tumor cells and cytomegalovirus infected endothelial cells In addition to classical functions such as cytokine production and cytotoxicity recent studies suggest that subsets of T cells can exert additional functions such as regulatory activity and quite surprisingly professional antigen presenting capacity It is currently not well known how this tremendous extent of functional plasticity is regulated and what is the extent of TCR ligand diversity Due to their non MHC restricted recognition of unusual stress associated ligands T cells have raised great interest as to their potential translational application in cell based immunotherapy Topics of this Research Focus include Molecular insights into the activation and differentiation requirements of T cells role of pyrophosphates and butyrophilin molecules for the activation of human T cells role of T cells in tumor immunity and in other infectious and non infectious diseases and many others We are most grateful to all colleagues who agreed to write a manuscript Thanks to their contributions this E book presents an up to date overview on many facets of the still exciting T cells Dieter Kabelitz Julie D chanet Merville

**Differentiation and Mechanisms of Activation of Innate Lymphoid Cells** Marina Cella, Chiara Romagnani, 2019-08-12

**Thymus Transcriptome and Cell Biology** Geraldo A. Passos, 2019-04-11 This volume focuses on challenging field in biomedicine that is the genetic control of central immune tolerance It covers the thymus development their cellular components and their respective function the peculiar gene expression profiling transcriptome found in the medullary thymic epithelial cells mTECs that are implicated in the self representation in the thymus the Autoimmune regulator Aire gene the mutations in this gene and manifestation of autoimmune diseases and the role of cell cell interactions within the thymus with implications in the negative selection elimination of nascent autoreactive T cells in preventing aggressive autoimmunity The thymus gland is a lymphoid organ implicated in the maturation differentiation and selection of T cells This organ is gained more and more attention in different biomedical research labs worldwide due to its function that is associated with the control of immune homeostasis in the body establishing the central immune tolerance and preventing the onset of autoimmune diseases
