Floor structures account for the majority of all structural material incorporated into a typical building and plate theories provide the information required to design them This comprehensive book provides a wide ranging account of the theoretical aspects of plate and slab theory in essence structural floors followed by a discussion of the construction and design of real plate and slab elements The early chapters discuss kinematics and statics then the theories of elastic and plastic plates and slabs are developed and studied The novel methods described are capable of providing safe lower bounds on the collapse loads for a wide range of shapes and types of floor Then follows a discussion of what criteria should be met by a construction method These criteria are used to develop design principles for what is termed the preferred method of construction Worked examples and exercises are provided throughout The final sections include more lengthy exercises an extensive annotated bibliography and some brief historical notes on the evolution of the subject

Recommendations for the design of flat slabs in post tension concrete using unbonded and bonded tendons FIB -

International Federation for Structural Concrete,1980-05-01 These recommendations present a guide to the design of two way spanning post tensioned concrete flat slabs using unbonded or bonded tendons Recommendations purely related to the use of unbonded tendons are clearly marked These recommendations are intended only for the design of post tensioned flat slabs in buildings and do not include the use in bridges Post tensioned concrete construction can be defined as unbonded or bonded depending on whether the tendon ducts are filled with a cement grout in order to provide a bonded structure or

whether the tendons are suitably coated and wrapped or greased and plastic covered unbonded While in a number of countries e g United States and Canada economic and construction considerations have resulted in the selection of unbonded tendons in other countries the use of the traditional bonded tendons is favoured e g Australia Some of the advantages claimed for the use of unbonded tendons can be summarized as follows Extremely low friction values tendons are fully protected against corrosion during construction maximum possible tendon drape due to the small diameter of the tendon this is of major importance in slender structures such as flat plates simple and fast placement of the tendons avoidance of grouting operations When tendons are grouted after stressing the claimed advantages are particularly that the bond between the concrete structure and the tendons increases the ultimate strength and less reliance is placed on the long term adequacy of the anchorage
