

## ❖ Beach Replenishment

One of the most popular soft engineering techniques of coastal management is beach replenishment or nourishment. This involves importing sand off the beach and piling it on top of the existing sands. Beach nourishment can be used alongside the Groyne structures.

*Fig 6: Beach Replenishment*

However, this is a slow and expensive process as sand is dredged from a near-shore location, transported to the beach to be restored, and pumped into the beach.

Being broadly interdisciplinary in its treatment of coasts the Encyclopedia of Coastal Science features contributions by 245 well known international specialists in their respective fields and is abundantly illustrated with line drawings and photographs Not only does this volume offer an extensive number of entries it also includes various appendices an illustrated glossary of coastal geomorphology and extensive bibliographic listings This Encyclopedia thus provides a comprehensive reference work for students professionals as well as informed lay readers Advances in Coastal and Ocean Engineering

Philip L. F. Liu, 1996 This volume contains six papers discussing coastal processes and physical and numerical modeling In the first paper Svendsen and Putrevu give an extensive review on the state of understanding of surf zone hydrodynamics including subjects such as wave breaking wave induced currents and instability of nearshore currents and infragravity waves They point out that the most urgent need is to develop an adequate theory for wave breaking and broken waves in the surf zone One of the methods for studying the complex coastal processes is to perform laboratory experiments However physical models are always plagued by scale and laboratory effects because the coastal process involves many different length and time scales In the second paper Kamphuis presents a detailed discussion on the sources and implications of the scale and laboratory effects on physical modeling The third and the fourth papers are two parts of the discussion on the mathematical modeling of the meso tidal barrier island coasts To understand the dynamics of coastal inlet systems one can either rely on empirical knowledge and construct various forms of empirical and semi empirical models Part I or develop a set of mathematical models based on the physical processes Part II Although these models do not provide the details of the dynamics they give valuable knowledge of the equilibrium state relationships de Vriend and Ribberink give a detailed review on two models Initial Sedimentation Erosion models and Medium Term Morphodynamic models They have also presented many examples of applications In the fifth paper Houston gives a brief review on different methods to mitigate beach loss caused by storms or persistent long term erosion He then describes in detail the method of beach nourishment which is also called a beach fill This paper discusses the information that must be collected to design a beach fill and that should be monitored after the completion of the project The last paper of this volume shifts our attention to the design of offshore structures such as gravity structures floating barges and tankers Chakrabarti discusses the effects of the uniform and shear currents on fixed and floating structures **ASCE Combined Index** American Society of Civil Engineers, 1998 Indexes materials appearing in the Society's Journals Transactions Manuals and reports Special publications and Civil engineering
