

Global climate trends

Global Climate trends show an increasingly warm planet. Changes in temperature, precipitation and increasing extreme events may affect yield of food crops and livestock and pose a food security risk, especially for vulnerable regions of the world.

Global average temperature change

+1°C
 Increase in global average temperature since pre-industrial climate

The global average temperature is projected to increase by 2-4°C above pre-industrial climate by 2050.

The largest increases are projected for the high latitude regions and lesser increases in tropical and sub-tropical areas.

Global precipitation anomalies

Increasing abnormal precipitation amounts have been recorded when compared with the average precipitation from 1961 to 2000 based on rainfall and snowfall measurements.

Changes in timing and intensity of rainfall events could significantly impact food and livestock production in rainfall dependent regions.

Drought 34%

of agricultural production loss in least developed, lower and middle income countries from 2008-2038

Stability, the great asset for the major crops (barley, maize, rice, sorghum, soy bean and wheat) have seen an increase in the percentage of area affected by drought since the 1980s, from approximately 10-12% to 12-20%.

Flood 19%

of agricultural production loss in least developed, lower and middle income countries from 2008-2038

There is a high amount of flood events in Asia Pacific, Central, West Asia and North Africa, Latin America and sub-Saharan Africa, affecting growth and yield of staple crops such as cassava, wheat, maize, and sorghum.

Storm 18%

of agricultural production loss in least developed, lower and middle income countries from 2008-2038

There is a high amount of storm events in Asia Pacific, Central, West Asia and North Africa, Latin America and sub-Saharan Africa, affecting growth and yield of staple crops such as cassava, wheat, maize, and sorghum.

Frequency of extreme events across world regions

Legend: Drought (Yellow), Extreme temperature (Orange), Flood (Green), Landslide (Grey), Storm (Blue), Wildfire (Red)

Climate vulnerable crops and livestock

Staple crops such as wheat, soy bean, rice and maize are a major part of diet globally and supply a major proportion of energy and nutrient needs. A decline in production would mean a drastic change in diet and food, posing a food security risk, especially in vulnerable regions. Current models project a decrease in global yield of these staple crops per degree Celsius increase in global mean temperature.

As a means of livelihood and source of food, livestock farming, especially of pastoral animals is threatened by climate change. Global projections estimate a decline in livestock of up to 7-10% due to climate change with economic losses between \$9.7 and \$12.6 billion.

Climate vulnerable regions

The vulnerability index measuring country exposure, sensitivity and ability to adapt to the impact of climate change, shows low and lower middle income countries, especially are highly vulnerable to climate change impact.

Spotlight on the most climate vulnerable countries

- Somalia**
Index: 0.679/1
- Niger**
Index: 0.632/1
- Chad**
Index: 0.632/1

The past five rainy seasons in Somalia, there has been inadequate levels of rainfall for harvesting and keeping livestock. This has resulted in almost total crop failure and a lack of rural employment opportunities.

Niger is experiencing increasing temperatures and unpredictable rainfall patterns that have resulted in more frequent and severe droughts.

In the fall of 2022, Chad experienced the worst flooding in 30 years with more than 1 million people affected and 1,483,34 acres of farmland destroyed.

Climate Change And Global Crop Productivity:

Climate Change and Global Crop Productivity K. R. Reddy, H. F. Hodges, 2000-04-25 Annotation Worldwide climatic changes have been raising concerns about potential changes to crop yields and production systems Such concerns include the ability to accommodate these uncertain effects in order to ensure an adequate food supply for an increasing population Written by leading international experts this book is the first comprehensive examination of the potential effects climate change particularly green house gases will have on agroecosystems It also reviews the effects such systems have on climate change itself Climate Change and Global Crop Productivity K. Global Environmental Change and Agriculture George B. Frisvold,Betsey Kuhn,1999 Global Environmental Change and Agriculture offers a comprehensive perspective on the causes consequences and possible policy solutions for climatic change as we move into the twenty first century It assesses the impact of potential future global climate change on agriculture and the need to sustain agricultural growth for economic development The book begins by examining the role of international research institutions in overcoming environmental constraints on sustainable agricultural growth and economic development The authors then discuss how agricultural research systems may be restructured to respond to global environmental problems such as climate change and loss of genetic diversity The discussion then extends to consider environmental accounting and indexing to illustrate how environmental quality can be included formally in measures of national income social welfare and sustainability The third part of the book focuses on the effects of and policy responses to climate change Chapters examine the effect of climate change on production trade land use patterns and livelihoods They consider impacts on the distribution of income between developed and developing countries and between different social classes within the developing world where agriculture remains a major economic activity Authors take on an economy wide perspective to draw lessons for agricultural trade land use and tax policy This book will be of special interest to agricultural development and environmental economists as well as policy analysts in government and at international agencies confronting practical problems of environmental and economic assessment **Climate Change Biology** Jonathan A. Newman,2011 Climate change has moved from a contested phenomenon to the top of the agenda at global summits Climate Change Biology is the first major textbook to address the critical issue of how climate change may affect life on the planet and particularly its impact on human populations Presented in three parts the first deals extensively with the physical evidence of climate change and various modelling efforts to predict its future Biological responses are then addressed from the individual s physiology to populations and ecosystems and further to considering adaptation and evolution The final section examines the specific impact climate change may have on natural resources particularly as these relate to human livelihood This volume will be a useful asset to the growing number of both undergraduate and graduate courses on impacts of climate change as well as providing a succinct overview for researchers new to the field *Proceedings of the International Grassland Conference* ,2001 *Anais do Congresso Internacional de Pastagens* ,2001 *Proceedings of the 4th International Symposium on Models for Plant Growth and Control in Greenhouses: Modeling for the 21st Century--Agronomic and Greenhouse Crop Models* J.
