Encyclopedia of Global Warming and Climate Change, Second Edition S. George Philander, 2012-06-13 The First Edition of the Encyclopedia of Global Warming and Climate Change provided a multi authored academic yet non technical resource for students and teachers to understand the importance of global warming to appreciate the effects of human activity and greenhouse gases around the world and to learn the history of climate change and the research enterprise examining it This edition was well received with notable reviews Since its publication the debate over the advent of global warming at least partially brought on by human enterprise has continued to ebb and flow depending literally on the weather politics and media coverage of climate summits and debates Advances in research also change the discourse as new data is collected and new scientific projects continue to explore and explain global warming and climate change Thus a new Second Edition updates more than half of the original entries and adds new perspectives and content to keep students and researchers up to date in a field that has proven provocatively lively *The Weather Almanac* Steven L. Horstmeyer, 2011-09-23 The Weather Almanac 12th Edition is a resource for a variety of climate and meteorological data including both domestic and international weather trends historical weather patterns dating back 1000 years natural disasters and a 20 page glossary of weather terminology The book is complete with detailed maps pictures and tables compiling climate data from a variety of sources including the National Weather Service and the US Geological Survey Separate sections in The Weather Almanac are devoted to tornadoes hurricanes thunderstorms and lightning flash floods and winter storms and they have been edited from official reports by governmental agencies The new edition has been updated to include recent disasters such as the 2004 Indian Ocean Tsunami that devastated Indonesia as well as 2005 s Hurricane Katrina These chapters serve as a basic reference for severe weather and extreme conditions which can assist in

Climate Change Governance in Asia Kuei-Tien Chou, Koichi Hasegawa, Dowan

Ku, Shu-Fen Kao, 2020-07-19 Asian countries are among the largest contributors to climate change. China, India, Japan, and South Korea are among the top ten largest carbon emitters in the world, with South Korea, Japan, and Taiwan also some of the largest on a per capita basis. At the same time, many Asian countries, notably India, Taiwan, Japan, the Philippines, and Thailand, are among those most affected by climate change in terms of economic losses attributed to climate-related disasters. Asia is an extremely diverse region in terms of the political regimes of its constituent countries and of their level of development and the nature of their civil societies. As such, its countries are producing a wide range of governance approaches to climate change. Covering the diversity of climate change governance in Asia, this book presents cosmopolitan governance from the perspective of urban and rural communities, local and central governments, state-society relations, and international relations. In doing so, it offers both a valuable overview of individual Asian countries' approaches to climate change governance and a series of case studies for finding solutions to climate change challenges.

Water Temperature Characteristics of Lakes Subjected to Climate Change Midhat Hondzo, Heinz G. Stefan, 1992 A deterministic one-dimensional unsteady lake water temperature model was modified and validated to simulate the seasonal spring-to-fall temperature stratification structure over a wide range of lake morphometries, trophic, and meteorological conditions. Model coefficients related to hypolimnetic eddy diffusivity, light attenuation, wind sheltering, and convective heat transfer were generalized using theoretical and empirical extensions. Propagation of uncertainty in the lake temperature model was studied using a vector state space method. The output uncertainty was defined as the result of deviations of meteorological variables from their mean values. Surface water temperatures were affected by uncertain meteorological forcing. Air temperature and dew point temperature fluctuations had significant effects on lake temperature uncertainty. The method presents a useful alternative for studying long-term averages and variability of the water temperature structure in lakes due to variable meteorological forcing. The lake water temperature model was linked to a daily meteorological data base to simulate daily water temperature in several specific lakes as well as 27 lake classes characteristic for the north-central US. Case studies of lake water temperature and stratification response to variable climate were made in a particularly warm year (1988) and a more normal one (1971). A regional analysis was conducted for 27 lake classes over a period of twenty-five years (1955-1979). Output from a global climate model (GISS) was used to modify the meteorological data base to account for a doubling of atmospheric CO₂. The simulations predict that after climate change: 1) epilimnetic water temperatures will be higher but will increase less than air temperature; 2) hypolimnetic temperatures in seasonally stratified dimictic lakes will be largely unchanged and in some cases lower than at present; 3) evaporative water loss will be increased by as much as 300 mm for the open water season; 4) onset of stratification will occur earlier and overturn will occur later in the season; and 5) overall lake stability will become greater in spring and summer.

Carbon-Neutral Architectural Design Pablo M. La Roche,2024-05-31 The energy used to build and operate buildings is a significant source of greenhouse gas emissions While it is possible to reduce emissions through low carbon design many architects are not trained to do this Filling an urgent need for a design reference in this emerging field this book describes how to reduce building related greenhouse gas emissions through appropriate design techniques It presents strategies to achieve CO2 reductions with an emphasis on control of energy flows through the building envelope and passive cooling and heating strategies This new revised edition is updated throughout and includes a new section on embodied carbon and new chapters on daylighting and nature based cooling Features Adds new chapters on daylighting and nature based cooling with numerous updates throughout the rest of the chapters Presents strategies illustrated with examples for new construction and existing buildings to reduce energy consumption and reduce emissions Explains the origins of CO2 emissions associated with the operation and fabrication of buildings supplying water disposing of waste from the building and proposes strategies to reduce them Covers carbon calculations thermal comfort indigenous technology climate responsive design passive cooling and heating solar design air flow analysis daylighting building simulation and microclimate design with abundant examples Examines siting location to design buildings that adapt and mitigate their effect on climate change The Journal of Geography ,1923 Agroforestry in South Asia William Ross Bentley,1993 FOSSIL RECORD 8 Spencer G.
