

WHAT IS CLIMATE?

Climate is the overall average weather at a place over a period of time.

The difference between climate and weather is that weather refers to a short-term state of the atmosphere and climate refers to a long-term pattern of weather.

There are approximately five main climate types on Earth: *tropical, dry, temperate, continental, and polar.*

Encyclopedia of Global Warming and Climate Change, Second Edition S. George Philander, 2012-06-13 The First Edition of the *Encyclopedia of Global Warming and Climate Change* provided a multi authored academic yet non technical resource for students and teachers to understand the importance of global warming to appreciate the effects of human activity and greenhouse gases around the world and to learn the history of climate change and the research enterprise examining it This edition was well received with notable reviews Since its publication the debate over the advent of global warming at least partially brought on by human enterprise has continued to ebb and flow depending literally on the weather politics and media coverage of climate summits and debates Advances in research also change the discourse as new data is collected and new scientific projects continue to explore and explain global warming and climate change Thus a new Second Edition updates more than half of the original entries and adds new perspectives and content to keep students and researchers up to date in a field that has proven provocatively lively *Climates and weather explained* E. Bonacina, 1911 **Dynamic Analysis of Weather and Climate** Marcel Leroux, 1998-10-27 *Dynamic Analysis of Weather and Climate Atmospheric Circulation Perturbations Climatic Evolution* Marcel Leroux This is an up to date textbook on meteorology and climatology with a fresh unconventional view of the workings of the climate system in which the author poses serious questions about the validity of certain aspects of current global warming theory The book is divided into three parts In Part I the author discusses general circulation in the troposphere He argues that such circulation is driven by thermal deficit at the poles causing Moving Polar Highs MPHs which have the principal role of feeding cold air towards the tropics This in turn causes warm air to move up

towards the poles The relief and distribution of land masses and the Earth's rotation control the trajectories of the MPHs and the formation of Anticyclonic Agglutinations AAs The latter determine the properties of tropical circulation the trade winds and tropical monsoons These discussions lead in Part II to a consideration of the dynamics of the weather through the study of perturbations including precipitation the role of MPHs in polar and temperate regions and at tropical margins pulsations in the trade winds and monsoons the concept of the meteorological Equator and tropical cyclones Part III reviews the causes of climatic variations including solar activity variations relating to the Earth's orbit and axial inclination volcanic eruptions and the anthropogenic greenhouse effect The book concludes with a discussion of Palaeoclimatic variations and recent climatic evolution including the Sahelian drought changes in polar and alpine glaciers and the El Nino Southern Oscillation
