## Chronic Obstructive Pulmonary Disease

COPD is the abbreviation for "chronic obstructive pulmonary disease". The concept covers a group of chronic diseases primarily characterized by diminished breath flow or expiration due to obstruction of the bronchi. Chronic obstructive pulmonary conditions include chronic obstructive bronchitis and lung emphysema, which usually occur in combination, but can exist with either severity.

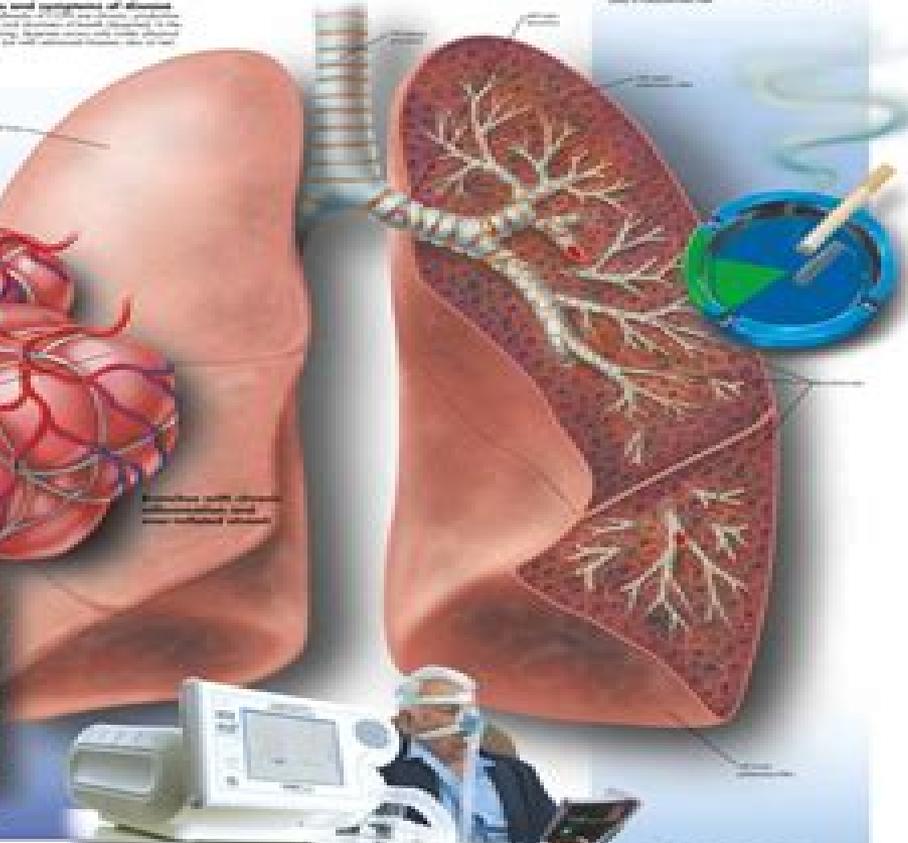

**Signs and symptoms of disease**  
COPD is a progressive disease. The signs and symptoms of COPD include chronic cough, sputum production, and shortness of breath. These symptoms usually occur in combination, but can exist with either severity.

**Causes of COPD**  
COPD is a chronic disease, affecting most or all of the lungs. The most common cause is cigarette smoking. Other causes include long-term exposure to dust, fumes, and pollutants. COPD is also caused by genetic factors, such as alpha-1 antitrypsin deficiency. COPD is a leading cause of death and disability in the United States.

**Lung emphysema**  
Lung emphysema is a chronic disease that destroys the lung tissue, making it difficult to breathe. It is caused by long-term exposure to irritants, such as cigarette smoke. The disease is characterized by enlarged air spaces and destruction of the alveoli, the small air sacs in the lungs. This leads to a loss of elasticity and a decrease in the surface area available for gas exchange.

**COPD**

**It's the expansion of the lung**  
In COPD, the lung tissue is destroyed, leading to a loss of elasticity and a decrease in the surface area available for gas exchange. This results in hyperinflation of the lungs, which is visible on a chest X-ray as enlarged lung fields and flattened diaphragms.

**Chronic bronchitis**  
Chronic bronchitis is a chronic disease that causes inflammation and swelling of the bronchi. It is characterized by a persistent cough with sputum production. The disease is caused by long-term exposure to irritants, such as cigarette smoke.

**Expiratory flow**  
Expiratory flow is the volume of air that is expired from the lungs during a single expiration. It is a measure of the strength of the expiratory muscles and the elasticity of the lung tissue. In COPD, the expiratory flow is significantly reduced.

**Practical advice for COPD patients**  
Patients with COPD should avoid smoking and exposure to pollutants. They should use their inhalers as directed and take their medications regularly. Regular exercise and a healthy diet can help improve their quality of life. Patients should also avoid respiratory infections and seek medical attention if their symptoms worsen.
