## **Amiodarone Profile:**

**Analytical Profiles of Drug Substances and Excipients**, 1992-02-03 Although the official compendia define a drug substance as to identity purity strength and quality they normally do not provide other physical or chemical data nor do they list methods of synthesis or pathways of physical or biological degradation and metabolism Such information is scattered throughout the scientific literature and the files of pharmaceutical laboratories Analytical Profiles of Drug Substances brings this information together into one source [Amiodarone Profile](#) Robert A. A. Maes, 1990-05-28 There has been a growing interest in serum drug monitoring over the past decade since it has become obvious that drugs are more often over or underadministered than was generally considered to be the case For instance a retrospective study covering several years found that phenytoin and theophylline concentrations were within the therapeutic range in only about 50 % of the cases studied Retrospective and current studies showed a clinical need for the individualisation of dosage regimes based on drug monitoring e g in the cases of theophylline tobramycin antiarrhythmics and some antiepileptics This manuscript is a result of the penetrating discussions within the working group Drug Monitoring of the Deutsche Forschungsgemeinschaft It appears in a series of publications of the Senate Commission for Clinical Toxicological Analysis dealing with monitoring of those drugs for which the determination of the concentration in blood is of paramount importance for a state of the art therapy Profiles on other drugs e g phenytoin digoxin methotrexate and cyclosporine will follow *Toxicological Profile for Iodine*, 2004
