## Discrete Iterations:

Discrete Iterations Francois Robert, 2012-12-06 a c 9 h In presenting this monograph I would like to indicate both its orientation as well as my personal reasons for being interested in discrete iterations that is iterations on a generally very large finite set While working in numerical analysis I have been interested in two main aspects the algorithmic aspect an iterative algorithm is a mathematical entity which behaves in a dynamic fashion Even if it is started far from a solution it will often tend to get closer and closer the mathematical aspect this consists of a coherent and rigorous analysis of convergence with the aid of mathematical tools these tools are mainly the use of norms for convergence proofs the use of matrix algebra and so on One may for example refer to the algorithmic and mathematical aspects of Newton's method in JRn as well as to the QR algorithm for eigenvalues of matrices These two algorithms seem to me to be the most fascinating algorithms in numerical analysis since both show a remarkable practical efficiency even though there exist relatively few global convergence results for them

Disordered Systems and Biological Organization E. Bienenstock, F. Fogelman Soulie, G. Weisbuch, 2012-12-06 The NATO workshop on Disordered Systems and Biological Organization was attended in march 1985 by 65 scientists representing a large variety of fields Mathematics Computer Science Physics and Biology It was the purpose of this interdisciplinary workshop to shed light on the conceptual connections existing between fields of research apparently as different as automata theory combinatorial optimization spin glasses and modeling of biological systems all of them concerned with the global organization of complex systems locally interconnected Common to many contributions to this volume is the underlying analogy between biological systems and spin glasses they share the same properties of stability and diversity This is the case for instance of primary sequences of biopolymers like proteins and nucleic acids considered as the result of mutation selection processes P W Anderson 1983 or of evolving biological species G Weisbuch 1984 Some of the most striking aspects of our cognitive apparatus involved in learning and recognition J Hopfield 1982 can also be described in terms of stability and diversity in a suitable configuration space These interpretations and preoccupations merge with those of theoretical biologists like S Kauffman 1969 genetic networks and of mathematicians of automata theory the dynamics of networks of automata can be interpreted in terms of organization of a system in multiple possible attractors The present introduction outlines the relationships between the contributions presented at the workshop and briefly discusses each paper in its particular scientific context

*High-Level Modeling and Synthesis of Analog Integrated Systems* Ewout S. J. Martens, Georges Gielen, 2008-01-03 As the miniaturization of semiconductor technology continues electronic systems on chips offer a more extensive and more complex functionality with better performance higher frequencies and less power consumption Whereas digital designers can take full advantage of the availability of design automation tools to build huge systems the lack of support by computer programs for different abstraction levels makes analog design a time consuming handcraft which

limits the possibilities to implement large systems Various approaches for finding optimal values for the parameters of analog cells like opamps have been investigated since the mid 1980s and they have made their entrance in commercial applications However a larger impact on the performance is expected if tools are developed which operate on a higher abstraction level and consider multiple architectural choices to realize a particular functionality In this book the opportunities conditions problems solutions and systematic methodologies for this new generation of analog CAD tools are examined

The outline of this book is as follows In the first part the characteristics of the analog design process are systematically analyzed and several approaches for automated analog synthesis are summarized Comparison of their properties with the requirements for high level synthesis of analog and mixed signal systems results in a new design paradigm the high level design now based on generic behavior This design approach involves a modeling strategy using generic behavioral models and a synthesis strategy leading to the exploration of a heterogeneous design space containing different architectures The modeling strategy is further elaborated in Part II

**Chaos Applications in Telecommunications** Peter Stavroulakis, 2005-10-31 The concept of transmitting information from one chaotic system to another derives from the observation of the synchronization of two chaotic systems Having developed two chaotic systems that can be synchronized scientists can modulate on one phase signal the information to be transmitted and subtract demodulate the information from the corresponding signal

Random Differential Equations in Scientific Computing Tobias Neckel, Florian Rupp, 2013-12-17 This book is a holistic and self contained treatment of the analysis and numerics of random differential equations from a problem centred point of view An interdisciplinary approach is applied by considering state of the art concepts of both dynamical systems and scientific computing The red line pervading this book is the two fold reduction of a random partial differential equation disturbed by some external force as present in many important applications in science and engineering First the random partial differential equation is reduced to a set of random ordinary differential equations in the spirit of the method of lines These are then further reduced to a family of deterministic ordinary differential equations The monograph will be of benefit not only to mathematicians but can also be used for interdisciplinary courses in informatics and engineering
