Concurrent Scientific Computing Eric F. Van de Velde, 2013-12-17 Mathematics is playing an ever more important role in the physical and biological sciences provoking a blurring of boundaries between scientific disciplines and a resurgence of interest in the modern as well as the classical techniques of applied mathematics This renewal of interest both in research and teaching has led to the establishment of the series Texts in Applied Mathematics TAM The development of new courses is a natural consequence of a high level of excitement on the research frontier as newer techniques such as numerical and symbolic computer systems dynamical systems and chaos mix with and reinforce the traditional methods of applied

mathematics Thus the purpose of this textbook series is to meet the current and future needs of these advances and encourage the teaching of new courses TAM will publish textbooks suitable for use in advanced undergraduate and beginning graduate courses and will complement the Applied Mathematical Sciences AMS series which will focus on advanced textbooks and research level monographs Preface A successful concurrent numerical simulation requires physics and mathematics to develop and analyze the model numerical analysis to develop solution methods and computer science to develop a concurrent implementation No single course can or should cover all these disciplines Instead this course on concurrent scientific computing focuses on a topic that is not covered or is insufficiently covered by other disciplines the algorithmic structure of numerical methods
