Model-Based Hypothesis Testing in Biomedicine Rikard

Johansson, 2017-10-03 The utilization of mathematical tools within biology and medicine has traditionally been less widespread compared to other hard sciences such as physics and chemistry. However, an increased need for tools such as data processing, bioinformatics, statistics, and mathematical modeling have emerged due to advancements during the last decades. These advancements are partly due to the development of high throughput experimental procedures and techniques which produce ever increasing amounts of data. For all aspects of biology and medicine, these data reveal a high level of interconnectivity between components which operate on many levels of control and with multiple feedbacks both between and within each level of control. However, the availability of these large scale data is not synonymous to a detailed mechanistic understanding of the underlying system. Rather, a mechanistic understanding is gained first when we construct a hypothesis and test its predictions experimentally. Identifying interesting predictions that are quantitative in nature generally requires mathematical modeling. This in turn requires that the studied system can be formulated into a mathematical model such as a series of ordinary differential equations where different hypotheses can be expressed as precise mathematical expressions that influence the output of the model. Within specific sub domains of biology, the utilization of mathematical models have had a long tradition such as the modeling done on electrophysiology by Hodgkin and Huxley in the 1950s. However, it is only in recent years with the arrival of the field known as systems biology that mathematical modeling has become more commonplace. The somewhat slow adaptation of mathematical modeling in biology is partly due to historical differences in training and terminology as well as in a lack of awareness of showcases illustrating how modeling can make a difference or even be required for a correct analysis of the experimental data. In this work, I provide such showcases by demonstrating the universality and applicability of mathematical modeling and hypothesis testing in three disparate biological systems. In Paper II, we demonstrate how mathematical modeling is necessary for the correct interpretation and analysis of dominant negative inhibition data in insulin signaling in primary human adipocytes. In Paper III, we use modeling to determine transport rates across the nuclear membrane in yeast cells and we show how this technique is superior to traditional curve fitting methods. We also demonstrate the issue of population heterogeneity and the need to account for individual differences between cells and the population at large. In Paper IV, we use mathematical modeling to reject three hypotheses concerning the phenomenon of facilitation in pyramidal nerve cells in rats and mice. We also show how one surviving hypothesis can explain all data and adequately describe independent validation data. Finally, in Paper I, we develop a method for model selection and discrimination using parametric bootstrapping and the combination of several different empirical distributions of traditional statistical tests. We show how the empirical log likelihood ratio test is the best combination of two tests and how this can be used not only for model selection but also for model discrimination. In conclusion, mathematical modeling is a valuable tool for analyzing data and testing biological hypotheses regardless of the underlying biological system. Further development of

modeling methods and applications are therefore important since these will in all likelihood play a crucial role in all future aspects of biology and medicine especially in dealing with the burden of increasing amounts of data that is made available with new experimental techniques Användandet av matematiska verktyg har inom biologi och medicin traditionellt sett varit mindre utbredd jämfört med andra områden inom naturvetenskapen så som fysik och kemi Ett stort behov av verktyg som databehandling bioinformatik statistik och matematisk modellering har fortsatt framåt tack vare framsteg under de senaste decennierna Dessa framsteg är delvis ett resultat av utvecklingen av storskaliga datainsamlingstekniker Inom alla områden av biologi och medicin så har dessa data avslöjat en hög nivå av interkonnektivitet mellan komponenter verksamma på många kontrollnivåer och med flera återkopplingar både mellan och inom varje nivå av kontroll Tillgång till storskaliga data är emellertid inte synonymt med en detaljerad mekanistisk förståelse för det underliggande systemet Snarare uppstår en mekanisk förståelse först när vi bygger en hypotes vars prediktioner vi kan testa experimentellt Att identifiera intressanta prediktioner som är av kvantitativ natur kräver generellt sett matematisk modellering Detta kräver i sin tur att det studerade systemet kan formuleras till en matematisk modell så som en serie ordinarie differentialekvationer där olika hypoteser kan uttryckas som precisa matematiska uttryck som påverkar modellens output Inom vissa delområden av biologin har utnyttjandet av matematiska modeller haft en lång tradition så som den modellering gjord inom elektrofysiologi av Hodgkin och Huxley på 1950-talet Det är emellertid just på senare år med ankomsten av fältet systembiologi som matematisk modellering har blivit ett vanligt inslag Den nya gott tillräckligt adapteringen av matematisk modellering inom biologi är både grundad i historiska skillnader i terminologi och terminologi samt brist på medvetenhet om exempel som illustrerar hur modellering kan ge skillnad och faktiskt ofta är ett krav för en korrekt analys av experimentella data I detta arbete tillhandahåller jag sådana exempel och demonstrerar den matematiska modelleringens och hypotestestningens allmänna giltighet och tillförlitlighet i tre olika biologiska system I Arbete II visar vi hur matematisk modellering är nödvändig för en korrekt tolkning och analys av dominant negativ inhiberingsdata vid insulinsignalering i primära humana adipocyter I Arbete III använder vi modellering för att bestämma transporthastigheter över cellkärnmembranet i jästceller och vi visar hur denna teknik överligger traditionella kurvpassningsmetoder Vi demonstrerar också förgån om populationsheterogenitet och behovet av att ta hänsyn till individuella skillnader mellan celler och befolkningen som helhet I Arbete IV använder vi matematisk modellering för att förkasta tre hypoteser om hur fenomenet facilitering uppstår i pyramidala nervceller hos råtta och mus Vi visar också hur en överlevande hypotes kan beskriva alla data inklusive oberoende valideringsdata Slutligen utvecklar vi i Arbete I en metod för modellselektion och modelldiskriminering med hjälp av parametrisk bootstrapping samt kombinationen av olika empiriska fördelningar av traditionella statistiska tester Vi visar hur det empiriska log likelihood ratio testet är den bästa kombinationen av två tester och hur testet är applicerbart inte bara för modellselektion utan också för modelldiskriminering Sammanfattningsvis är matematisk modellering ett värdefullt verktyg för att analysera data och testa biologiska hypoteser oavsett underliggande biologiskt system Vidare utveckling av

modelleringsmetoder och tillämpningar är därför viktigt eftersom dessa sannolikt kommer att spela en avgörande roll i framtiden för biologi och medicin särskilt när det gäller att hantera belastningen från ökande datamängder som blir tillgänglig med nya experimentella tekniker

Novelty, Information and Surprise Günther Palm, 2012-08-30 The book offers a new approach to information theory that is more general than the classical approach by Shannon The classical definition of information is given for an alphabet of symbols or for a set of mutually exclusive propositions a partition of the probability space with corresponding probabilities adding up to 1 The new definition is given for an arbitrary cover of i.e. for a set of possibly overlapping propositions The generalized information concept is called novelty and it is accompanied by two new concepts derived from it designated as information and surprise which describe opposite versions of novelty information being related more to classical information theory and surprise being related more to the classical concept of statistical significance In the discussion of these three concepts and their interrelations several properties or classes of covers are defined which turn out to be lattices The book also presents applications of these new concepts mostly in statistics and in neuroscience

Field Methods in Marine Science Scott Milroy, 2022-09-10 *Field Methods in Marine Science From Measurements to Models* is an authoritative guide of the methods most appropriate for field research within the marine sciences from experimental design to data analysis Written for upper level undergraduate and graduate students as well as early career researchers this textbook also serves as an accessible introduction to the concepts and practice of modeling marine system dynamics This textbook trains the next generation of field scientists to move beyond the classic methods of data collection and statistical analysis to contemporary methods of numerical modeling to pursue the assimilation and synthesis of information not the mere recording of data Boxes and side bars highlight important questions interesting facts relevant examples and research techniques that supplement the text Students and researchers alike will find the thorough appendices useful as a way of expanding comprehension of fundamental concepts
