S. Gupta,1992 *Crop Resistance Mechanisms to Alleviate Climate Change-Related Stress* Jose Ramon Acosta Motos,Juan De Dios Franco-Navarro,Sara Álvarez,María José Gómez-Bellot,2024-02-20 Anthropogenic activities have aggravated the effects of global climate change on ecosystems Plants because of their inability to escape from an adverse environment suffer to a great extent from stresses which can negatively impact their growth and development Global warming is increasingly causing extreme climatic situations such as very high or low temperatures drought and flooding events hailstorms wildfires extreme precipitation events and the reduction of fertile soil through desertification and salinization In addition warmer temperatures and higher humidity related with the climate change can also increase pest and disease pressure on plants by altering the geographic range population size and timing of pest and disease outbreaks Taken together abiotic stress related with climate change as drought or extreme temperature can exacerbate the spread and severity of various diseases associated with biotic stress increasing the vulnerability of plants to pathogens some examples include insects fungi bacteria or viruses **Plant Breeding For Stress Environments** Abraham Blum,2018-01-18 This publication opens with the inevitable introduction moves on to the present traditional approach to breeding for yield stability and then enumerates a detailed discussion of the physiological approach to breeding for resistance to specific stresses Not all environmental stresses are covered omitting those for which little can be said today on practical breeding solutions **Water Stress and Crop Plants** Parvaiz Ahmad,2016-06-08 Plants are subjected to a variety of abiotic stresses such as drought temperature salinity air pollution heavy metals UV radiations etc To survive under these harsh conditions plants are equipped with different resistance mechanisms which vary from species to species Due to the environmental fluctuations agricultural and horticultural crops are often exposed to different environmental stresses leading to decreased yield and problems in the growth and development of the crops Drought stress has been found to decrease the yield to an alarming rate of some important crops throughout the globe During last few decades lots of physiological and molecular works have been conducted under water stress in crop plants *Water Stress and Crop Plants A Sustainable Approach* presents an up to date in depth coverage of drought and flooding stress in plants including the types causes and consequences on plant growth and development It discusses the physiobiochemical molecular and omic approaches and responses of crop plants towards water stress Topics include nutritional stress oxidative stress hormonal regulation transgenic approaches mitigation of water stress approaches to sustainability and modern tools and techniques to alleviate the water stress on crop yields This practical book offers

pragmatic guidance for scientists and researchers in plant biology and agribusinesses and biotechnology companies dealing with agronomy and environment to mitigate the negative effects of stress and improve yield under stress The broad coverage also makes this a valuable guide enabling students to understand the physiological biochemical and molecular mechanisms of environmental stress in plants
