**Droughts of the Past and the Future** Karen J. Donnelly, 2003 Discusses the importance of water on earth what a drought is conditions that can cause droughts and the possibility of droughts in the future *Drought* Justin Sheffield, Eric F. Wood, 2012-11-12 Drought is one of the likely consequences of climate change in many regions of the world Together with an increased demand for water resources to supply the world's growing population it represents a potentially disastrous threat to water supplies agriculture and food production leading to famine and environmental degradation Yet predicting drought is fraught with difficulty The aim of this book is to provide a review of the historical occurrence of global drought particularly during the 20th century and assess the likely potential changes over the 21st century under climate change This includes documentation of the occurrence and impacts of major 20th century drought events and analysis of the contributing climatic and environmental factors that act to force prolong and dissipate drought Contemporary drought is placed in the context of climate variability since the last ice age including the many severe and lengthy drought events that contributed to the demise of great civilizations the disappearance of lakes and rivers and the conversion of forests to deserts The authors discuss the developing field of drought monitoring and seasonal forecasting and describe how this is vital for identifying emerging droughts and for providing timely warning to help reduce the impacts The book provides a broad overview of large scale drought from historic events such as the US Dust Bowl and African Sahel and places this in the context of climate variability and change The work is soundly based on detailed research that has looked at drought occurrence over the 20th century global drought monitoring modelling and seasonal prediction and future projections from climate models

### **Analyzing the Past and Future Drought Situations Using High Resolution Drought Index** Alen Shrestha,2020

Regional assessments of droughts are limited and meticulous assessment of droughts over larger spatial scales are often not substantial Understanding drought variability on a regional scale is crucial for enhancing resiliency and adaptive ability of water supply and distribution systems Moreover it can be essential for appraising the dynamics and predictability of droughts based on regional climate across various spatial and temporal scales The drought analysis of the past was carried out with the development of a high resolution dataset 1km 1km for three drought prone regions of India between 1950 and 2016 In the study the monthly values of self calibrating Palmer Drought Severity Index scPDSI incorporating Penman Monteith PM approximation which is physically based on potential evapotranspiration Climate data were statistically downscaled using the delta downscaling method and was formulated to form a timeline for characterizing major drought events that occurred in the past The downscaled climate data were validated with the station observations Major severe drought events that occurred between 1950 and 2016 were identified and studied with greater emphasis to the drought situation in smaller spatial extent such as districts villages or localities A timeline of drought events within the period of study was also prepared to have an understanding of the severity of drought in all three regions Likewise the future drought durations are projected for droughts of different levels of severity and assessed in the same regions of India Coupled Model Intercomparison Project Phase 6 CMIP6 simulated precipitation and climate data were used for near future 2015 2044 for different shared socio economic pathways SSPs scPDSI was used again based on its fairness in identifying drought conditions which accounts for the temperature as well Gridded rainfall and temperature data of spatial resolution of 1km were used to bias correct the multi model ensemble MME mean of 7 Global Climatic Models GCMs from CMIP6 project Equidistant quantile based mapping was adopted to remove the bias in the rainfall and temperature data and were corrected at the monthly scale The downscaled climate data exhibited good statistical agreement with station data with correlation coefficient R ranging from 0.83 to 0.93 for both precipitation and temperature Drought analysis indicated several major incidences over the analysis time period considered in this work which truly adheres to the droughts recorded in qualitative reports of meteorological institutions in those regions The drought study of the past helped to understand the situation in local levels and understand the necessities that can be opted for the future by proper management of water resources While the outcome of the future prediction of drought duration suggests multiple severe to extreme drought events in all three study areas of appreciable durations mostly during the mid 2030s under the SSP2 4.5 scenario The severe drought durations under the SSP2 4.5 scenario were found to be ranging around 25 to 30 months in 30 years period of the near future The high resolution drought index proved to be key to assess the drought situation for both the past and the future in three different drought prone regions of India
