Control Chaos Mathematical Modeling:

Control and Chaos Alistair Mees, Thomas L. Vincent, Kok L. Teo, Kevin Judd, 2012-12-06 This volume contains the proceedings of the US Australia workshop on Control and Chaos held in Honolulu Hawaii from 29 June to 1 July 1995 The workshop was jointly sponsored by the National Science Foundation USA and the Department of Industry Science and Technology Australia under the US Australia agreement Control and Chaos it brings back memories of the endless reruns of Get Smart where the good guys worked for Control and the bad guys were associated with Chaos In keeping with current events Control and Chaos are no longer adversaries but are now working together In fact bringing together workers in the two areas was the focus of the workshop The objective of the workshop was to bring together experts in dynamical systems theory and control theory and applications workers in both fields to focus on the problem of controlling nonlinear and potentially chaotic systems using limited control effort This involves finding and using orbits in nonlinear systems which can take a system from one region of state space to other regions where we wish to stabilize the system Control is used to generate useful chaotic trajectories where they do not exist and to identify and take advantage of useful ones where they do exist A controller must be able to nudge a system into a proper chaotic orbit and know when to come off that orbit Also it must be able to identify regions of state space where feedback control will be effective

Simple Mathematical Models of Gene Regulatory Dynamics Michael C. Mackey, Moisés Santillán, Marta Tyran-Kamińska, Eduardo S. Zeron, 2016-11-09 This is a short and self contained introduction to the field of mathematical modeling of gene networks in bacteria As an entry point to the field we focus on the analysis of simple gene network dynamics The notes commence with an introduction to the deterministic modeling of gene networks with extensive reference to applicable results coming from dynamical systems theory The second part of the notes treats extensively several approaches to the study of gene network dynamics in the presence of noise either arising from low numbers of molecules involved or due to noise external to the regulatory process The third and final part of the notes gives a detailed treatment of three well studied and concrete examples of gene network dynamics by considering the lactose operon the tryptophan operon and the lysis lysogeny switch The notes contain an index for easy location of particular topics as well as an extensive bibliography of the current literature The target audience of these notes are mainly graduates students and young researchers with a solid mathematical background calculus ordinary differential equations and probability theory at a minimum as well as with basic notions of biochemistry cell biology and molecular biology They are meant to serve as a readable and brief entry point into a field that is currently highly active and will allow the reader to grasp the current state of research and so prepare them for defining and tackling new research problems
