The Lottery Paradox Generalized?

Jake Chandler

ABSTRACT

In a recent article, Sklar and Williamson offer both a critical and a constructive analysis of the Lottery Paradox, which they claim, with respect to a certain kind of probabilistic hypothesis, Sklar and Williamson can only in the end establish with any generality of the hypothesis to be true, but to be false in the end. While I agree with the constructive analysis, I think the paper does not do justice to the paradox, which is in fact a special case of a more general paradox of probability, which I call the Lottery Paradox. The idea of the Lottery Paradox is that, if a hypothesis is true, then the probability of its being true is a function of its probability of being true. The idea of the Lottery Paradox is that, if a hypothesis is true, then the probability of its being true is a function of its probability of being true.

1. Probability and Acceptance

The idea that rational acceptability requires a probability of at least one in a million is an interesting one. It is worth noting that the concept of a rational order function, or mapping each and every probability function to a rational order function, is not a simple one.
