None of the individual programs carries this name but the various parts work reasonably well together and provide a powerful framework for many common calculations.^{1 2} The term Amber is also used to refer to the empirical force fields that are implemented here.^{3 4} It should be recognized however that the code and force field are separate; several other computer packages have implemented the Amber force fields and other force fields can be implemented with the Amber programs. Further, the force fields are in the public domain whereas the codes are distributed under a license agreement. The Amber software suite is divided into two parts: AmberTools²³, a collection of freely available programs mostly under the GPL license, and Amber²², which is centered around the pmemd simulation program and which continues to be licensed as before under a more restrictive license. Amber²² represents a significant change from the most recent previous version, Amber²⁰. We have moved to numbering Amber releases by the last two digits of the calendar year, so there are no odd-numbered versions. Please see <https://ambermd.org> for an overview of the most important changes. AmberTools is a set of programs for biomolecular simulation and analysis. They are designed to work well with each other and with the regular Amber suite of programs. You can perform many simulation tasks with AmberTools, and you can do more extensive simulations with the combination of AmberTools and Amber itself. Most components of AmberTools are released under the GNU General Public License (GPL). A few components are in the public domain or have other open source licenses. See the README file for more information.

Structural Studies of Alpha-lytic Protease at Sub-Angstrom Resolution Reveal Insights Into the Mechanisms of Serine Protease Catalysis and Kinetic Stability Cynthia Nichole Fuhrmann, 2005 For many decades alpha lytic protease alpha LP an extracellular bacterial protease secreted by *Lysobacter enzymogenes* has served as a model in both mechanistic and structural studies for chymotrypsin like serine proteases In order to address questions regarding the catalytic mechanism of serine proteases I determined three structures of alpha LP at ultra high resolution 1 the free enzyme at its active pH alpha LP pH 8.0 83 resolution 2 alpha LP at pH5 alpha LP pH 5.0 82 resolution and 3 alpha LP bound to a peptidyl boronic acid inhibitor McOSuc Ala Ala Pro boroVal alpha LP boroVal gol 0.90 resolution The latter two structures provided analogs to the transition states of the catalytic reaction The unexpected covalent binding of a glycerol molecule to the tetrahedral boronate in alpha LP boroVal gol provided the most accurate and highly resolved model of the tetrahedral intermediate for acylation TI 1 determined to date Structure specific radiation damage was apparent in electron density for these structures and special data collection techniques were used to minimize radiation damage observed at the Ser195 boronic acid adduct A comparison of all three structures elucidated the structural changes that occur during the first step of the catalytic reaction ES arrow right TI 1 We propose that upon deprotonation of His57 Ser195 undergoes a conformational change that is responsible for preventing the TI 1 arrow right ES back reaction Based on precise atomic positions obtained at

sub nanogram resolution we have concluded that the His57 Asp102 interaction is a standard ionic hydrogen bond in both the free enzyme and the acylation transition state and not a low barrier hydrogen bond as had been previously debated. Instead, I propose that transition state stabilization by chymotrypsin-like serine proteases is achieved through a network of optimized hydrogen bonds that position the catalytic triad and stabilize the Ser195 substrate tetrahedral adduct. In particular, I identified a short ionic hydrogen bond between His57 and the amide of the substrate leaving group that may play the primary role in catalyzing the second step of the acylation reaction. A surprising outcome from these studies was the discovery of a site of conformational strain that appears to be evolutionarily linked to alpha LP's kinetic stability. Distortion of Phe228, a conserved residue in the protein core, is estimated to account for 4 kcal/mol in conformational energy. The rearrangement and subsequent distortion of Phe228 by co-evolved residues surrounding it supports the hypothesis that tight packing in alpha LP is a key component of alpha LP's folding energy landscape. Subsequent mutational studies support this hypothesis, confirming our discovery of the first known functionally relevant distortion. **Pixel**, 1990 Proceedings, 1969 *The Structures, Functions, and Evolution of Sm-like Archaeal Proteins (SmAPs)* Cameron Mura, 2002 Dr. Dobb's Journal, 1997
