Animal Energetics:

Animal Energetics A. E. Brafield, Michael J. Llewellyn, 1982 This book describes how energy is measured how it is allocated to carry out the necessary physiological functions in the animal and how it is transferred through populations and ecosystems *Readings in Animal Energetics* Robert H. Catlett, 1973 **Animal Energetics** Alan E. Brafield, Michael J. Llewellyn, 2012-12-27 All animals from protozoans to primates utilize energy in every aspect of their lives Metabolic processes transform energy within the living cells Individual animals obtain energy with their food and use it in a variety of ways Populations and communities pass energy through their ecosystem The growing interest in animal energetics is therefore seen in three major areas of zoology biochemistry physiology and ecology We have tried to describe the main features of almost all these aspects with the aim of arousing or feeding an interest in energetics in general as well as supplying some information on particular parts of the subject The substantial list of references is intended to guide the reader to larger or more specialized works In covering such a wide field in so small a compass we will have been guilty of over generalizations but we find when teaching energetics whether physiological or ecological that students easily lose sight of the principles if all statements are hedged about with every relevant condition and exception We have drawn examples from a wide range of animals avoiding over emphasis on mammals but we have tended to favour those groups with which we are more familiar We are grateful to many people for helpful discussions and in particular to Kenneth Denbigh Derek Miller and John Stirling for valuable criticisms of parts of the manuscript We are responsible for all remaining errors of course and will welcome having them drawn to our notice A E B M J L Animal Energetics Alan E. McNeill Alexander,1999-01-28 The Oxford Animal Biology Series is an innovative new series of supplementary undergraduate texts in comparative animal biology Topics within each book are addressed using examples from throughout the animal kingdom looking for parallels that transcend taxonomy Further reading sections will guide the student into the literature at greater depth The series will be international in scope both in terms of the species used as examples and in references to scientific work Energy for Animal Life the first book in the series is about how animals get energy and how they use it a central topic in our understanding of animal biology Life depends on energy and much of the activity of animals is devoted to getting the food which is their energy source It encompasses the food chain from solar radiation and photosynthesis to food sources for herbivores and for carnivores and

compares the merits of different designs of digestive system and of different strategies for finding and choosing food. Of course animal energy isn't simply a question of feeding and several chapters in turn look at energy use. The energy costs of motion of running, swimming and flight are discussed in one chapter and the energetic demands of growth and reproduction in another. A chapter on body temperature shows how the processes of life go faster at higher temperatures and discusses how animals regulate their temperature. A final chapter draws all of these aspects of energy use together and considers the energy budgets of several different animals, assessing the different energy gains and costs of their everyday activities in the wild. The book is truly comparative, drawing on examples from a wide range of animal species and lots of practical information on relevant experiments is included. The style is very accessible and suitable as supplementary reading for first and second year undergraduates taking a degree course in biological sciences.
