as a text for beginning students in universities and colleges or for students who have already taken a course in general biology and wish to gain a more comprehensive view of the animal kingdom It differs from many of the college textbooks of zoology now on the market in several important respects 1 the animals and their organs are not only described but their functions are pointed out 2 the animals described are in most cases native species and 3 the relations of the animals to man are emphasized Besides serving as a textbook it is believed that this book will be of interest to the general reader since it gives a bird s eye view of the entire animal kingdom as we know it at the present time Within the past decade there has been a tendency for teachers of zoology to pay less attention to morphology and more to physiology As a prominent morphologist recently said Morphology is no longer in favor and among a section of the zoological world has almost fallen into disgrace Bourne The study of the form and structure of animals is however of fundamental importance and is absolutely necessary before physiological processes can be fully understood but a course which is built up on the old fashioned morphological lines is no longer adequate for the presentation of zoological principles In writing this book the author has attempted not only to describe the most important structural features of the various types of animals but also to point out the vital phenomena as expressed in the functions of the organs
