Animal Psychophysics The Design And Conduct Of Sensory Experiments:

Animal Psychophysics: the design and conduct of sensory experiments William C. Stebbins, 2013-11-21 In May of 1969 the contributors to this book gathered at the University of Michigan in Ann Arbor for three days to talk about their work in the behavioral analysis of animal sensory function and to share their research experiences in the laboratory with particular emphasis on methodology in behavioral training testing and instrumentation It was their feeling and mine as a consequence of this meeting that we had sufficient substance to justify a book which we hoped would be of interest and even of pragmatic value to any biologic or biomedical scientist whose work deals with sensory function Clearly there is no aspect of an organism s behavior that is not to some extent controlled by environmental stimuli In recent years due in large part to technical advances in microscopy and histology and in electrophysiology there have been several extremely informative published proceedings from conferences and symposia concerned with some of the early and very basic stages in the reception of environmental energy by the sense organs and its processing by the nervous system Transduction at the receptor and stimulus coding by the nervous system cell membrane changes and the basic structure of the receptor and related tissue as seen through the electron and phase contrast microscope have received major attention and exciting new discoveries in sensory function and structure have been reported Ultimately such discoveries must be related to an intact behaving organism

Twenty five years ago Bill Stebbins presented the principles of animal psychophysics in an edited volume Stebbins 1970 describing an array of modern creative methodologies for investigating the range of sensory systems in a variety of vertebrate species These principles included precise stimulus control a well defined behavioral response and a rigorous behavioral procedure appropriate to the organism under study As a generation of comparative sensory scientists applied these principles our knowledge of sensory and perceptual function in a wide range of animal species has grown dramatically especially in the field of hearing Comparative psychoacoustics i e the study of the hearing capabilities in animals using behavioral methods is an area of animal psychophysics that has seen remarkable advances in methodology over the past 25 years Acoustic stimuli are now routinely generated using digital methods providing the researcher with unprecedented possibilities for stimulus control and experimental design The strategies and paradigms for data collection and analysis are becoming more refined as well again due in large part to the widespread use of computers In this volume the reader will find a modern array of strategies designed to measure detection and discrimination of both simple and complex acoustic stimuli as well experimental designs to assess how organisms perceive identify and classify acoustic stimuli Refinements in modern methodologies now make it possible to compare diverse species tested under similar if not identical experimental conditions

Neocortical Modularity and the Cell Minicolumn Manuel F. Casanova,2005 Our everyday view of the world may not necessarily be the most comprehensive one In this regard neuropathologists should temper opinions based on a limited representation of reality Microscopy freezes in time a two dimensional representation of a minute histological process One must acquire knowledge of the physiology of the lesion before reaching a multidimensional diagnosis In the case of mental disorders the modular organisation of the cortex may offer some clues to underlying aetiology It is tissue rather than individual cells that provides for the phenomena of perceptual binding and gamma frequencies It is the continuous re entry of excitation into neuronal networks that provides for selective attention The basis for language and its semantic content resides in the conjoint activation of topographically diverse brain regions This book is designed to focus on the lowest hierarchical element within the modular organisation of the brain the cell minicolumn The minicolumn is a self contained ecosystem of neurons and their connections that repeats itself throughout the extent of the neocortex Although a few neuroanatomists at the turn of the century called attention to the vertical arrangement of the cortex Vernon Mountcastle provided physiological proof in the 1950 s for its existence and its role in perception Motivational Control Systems Analysis David McFarland,1974 Hearing and Other Senses Richard R.
