

Bornological, coarse and uniform groups

Igor Protasov

Abstract. We survey and analyze different ways in which bornologies, coarse structures and uniformities on a group agree with the group operations.

MSC: 20F69, 22A05, 54E35, 54H35

Keywords: bornology, coarse structure, uniformity, Stone-Ćech compactification.

1. BORNOLOGICAL GROUPS

1.1. Bornological spaces. A family \mathcal{I} of subsets of a set X is called an *ideal* (in the Boolean algebra \mathcal{P}_X of all subsets of X) if \mathcal{I} is closed under formation of finite unions and subsets. If $\bigcup \mathcal{I} = X$ then \mathcal{I} is called a *bornology*, so a bornology is an ideal containing the ideal \mathfrak{F}_X of all finite subsets.

A bornology \mathcal{B} on X is called *tall* if any infinite subset Y of X contains an infinite subset Z such that $Z \in \mathcal{B}$.

A bornology \mathcal{B} on X is called *antitall* if, for any $Y \subseteq X$, $Y \notin \mathcal{B}$, there exists $Z \subseteq Y$ such that $Z' \notin \mathcal{B}$ for each infinite subset Z' of Z .

By [1, Proposition 1], every bornology is the meet of some tall and antitall bornologies.

A family $\mathfrak{B} \subseteq \mathcal{B}$ is called a *base* of \mathcal{B} if, for any $A \in \mathcal{B}$, there exists $B \in \mathfrak{B}$ such that $A \subseteq B$. Every bornology with a countable base is antitall. In particular, a bornology of all bounded subsets of a metric space is antitall. We note also that, for every bornology \mathcal{B} on X with a countable base, there exists a metric d on X such that \mathcal{B} is a bornology of all bounded subsets of (X, d) .

A set X endowed with a bornology \mathcal{B} is called a *bornological space*, and is denoted by (X, \mathcal{B}) . Each subset $Y \in \mathcal{B}$ is called *bounded*. If $\mathcal{B} = \mathcal{P}_X$ then (X, \mathcal{B}) is *bounded*.

Let (X, \mathcal{B}) be a bornological space. Every subset $Y \subseteq X$ defines the bornological subspace (Y, \mathcal{B}_Y) , $\mathcal{B}_Y = \{Y \cap A : A \in \mathcal{B}\}$.

The product of a family of bornological spaces is the Cartesian product of its supports endowed with the Cartesian product of its bornologies.

A mapping $f : (X, \mathcal{B}) \rightarrow (X', \mathcal{B}')$ is called *bornologous* if $f(A) \in \mathcal{B}'$ for each $A \in \mathcal{B}$.

A *variety* is a class of bornological spaces closed under formation of subspaces, products and bornological images.

Bornologies and Functional Analysis, 1977-01-01 Bornologies and Functional Analysis Advanced Topics in Mathematical Analysis Michael Ruzhansky, Hemen Dutta, 2019-01-08 Advanced Topics in Mathematical Analysis is aimed at researchers graduate students and educators with an interest in mathematical analysis and in mathematics more generally The book aims to present theory methods and applications of the selected topics that have significant useful relevance to contemporary research *Local and Analytic Cyclic Homology* Ralf Meyer, 2007 Periodic cyclic homology is a homology theory for non commutative algebras that plays a similar role in non commutative geometry as de Rham cohomology for smooth manifolds While it produces good results for algebras of smooth or polynomial functions it fails for bigger algebras such as most Banach algebras or C algebras Analytic and local cyclic homology are variants of periodic cyclic homology that work better for such algebras In this book the author develops and compares these theories emphasizing their homological properties This includes the excision theorem invariance under passage to certain dense subalgebras a Universal Coefficient Theorem that relates them to K theory and the Chern Connes character for K theory and K homology The cyclic homology theories studied in this text require a good deal of functional analysis in bornological vector spaces which is supplied in the first chapters The focal points here are the relationship with inductive systems and the functional calculus in non commutative bornological algebras Some chapters are more elementary and independent of the rest of the book and will be of interest to researchers and students working on functional analysis and its applications **Topological Vector Spaces and Their Applications** V.I. Bogachev, O.G. Smolyanov, 2017-05-16 This book gives a compact exposition of the fundamentals of the theory of locally convex topological vector spaces Furthermore it contains a survey of the most important results of a more subtle nature which cannot be regarded as basic but knowledge which is useful for understanding applications Finally the book explores some of such applications connected with differential calculus and measure theory in infinite dimensional spaces These applications are a central aspect of the book which is why it is different from the wide range of existing texts on topological vector spaces Overall this book develops differential and integral calculus on infinite dimensional locally convex spaces by using methods and techniques of the theory of locally convex spaces The target readership includes mathematicians and physicists whose research is related to infinite dimensional analysis

Topological Algebras and Applications Anastasios Mallios, Marina Haralampidou, 2007 The Fifth International Conference on Topological Algebras and Applications was held in Athens Greece from June 27th to July 1st of 2005 The main topic of the Conference was general theory of topological algebras and its various applications with emphasis on the non normed case in addition to the study of the internal structure of non normed and even non locally convex topological algebras there are applications to other branches of mathematics such as differential geometry of smooth manifolds and mathematical physics such as quantum relativity and quantum cosmology Operator theory of unbounded operators and related non normed

topological algebras are intensively studied here Other topics presented in this volume are topological homological algebra

 differentiation covering non normable linear spaces have always involved arbitrary conditions This book bases the theory of
 differentiability of linear spaces on the fundamental idea of reducing the differentiability of general maps to that of functions
