Abstract

In this paper we present two algorithms for computing the *g-asymptotes* or *generalized asymptotes*, of a plane algebraic curve, \mathcal{C} , implicitly or parametrically defined. The asymptotes of a curve \mathcal{C} reflect the status of \mathcal{C} at points with sufficiently large coordinates. It is well known that an asymptote of a curve \mathcal{C} is a line such that the distance between \mathcal{C} and the line approaches zero as they tend to infinity. However, a curve \mathcal{C} may have more general curves than lines describing the status of \mathcal{C} at infinity. These curves are known as *g-asymptotes* or *generalized asymptotes*. The pseudocodes of these algorithms are presented, as well as the corresponding implementations. For this purpose, we use the algebra software `Maple`. A comparative analysis of the algorithms is carried out, based on some properties of the input curves and their results to analyze the efficiency of the algorithms and to establish comparative criteria. The results presented in this paper are a starting point to generalize this study to surfaces or to curves defined by a non-rational parametrization, as well as to improve the efficiency of the algorithms. Additionally, the methods developed can provide a new and different approach in prediction (regression) or classification algorithms in the machine learning field.

Advances in the Design of Symbolic Computation Systems Alfonso Miola, Marco Temperini, 2012-12-06 New methodological aspects related to design and implementation of symbolic computation systems are considered in this volume aiming at integrating such aspects into a homogeneous software environment for scientific computation. The proposed methodology is based on a combination of different techniques: algebraic specification through modular approach and completion algorithms approximated and exact algebraic computing methods, object oriented programming paradigm, automated theorem proving through methods like Hilbert and methods of natural deduction. In particular, the proposed treatment of mathematical objects via techniques for method abstraction, structures classification and exact representation, the programming methodology which supports the design and implementation issues and reasoning capabilities supported by the whole framework are described.

Numerical and Computer Methods in Structural Mechanics Steven J. Fenves, Nicholas Perrone, Arthur R. Robinson, 2014-05-10 Numerical and Computer Methods in Structural Mechanics is a compendium of papers that deals with the numerical methods in structural mechanics, computer techniques and computer capabilities. Some papers discuss the analytical basis of the computer technique most widely used in software, that is the finite element method. This method includes the convergence in terms of variation principles, isoparametrics, hybrid models and incompatible displacement models. Other papers explain the storage or retrieval of data as well as equation solving algorithms. Other papers describe general purpose structural mechanics programs, alternatives to and extension of the usual finite element

approaches Another paper explores nonlinear dynamic finite element problems and a direct physical approach to determine finite difference models Special papers explain structural mechanics used in computing particularly those related to integrated data bases such as in the Structures Oriented Exchange System of the Office of Naval Research and the integrated design of tanker structures Other papers describe software and hardware capabilities for example in ship design fracture mechanics biomechanics and crash safety The text is suitable for programmers computer engineers researchers and scientists involved in materials and industrial design
