B. Clark, 2000-03-02 We live in a dynamic economic and commercial world surrounded by objects of remarkable complexity and power. In many industries changes in products and technologies have brought with them new kinds of firms and forms of organization. We are discovering new ways of structuring work of bringing buyers and sellers together and of creating and using market information. Although our fast moving economy often seems to be outside of our influence or control human beings create the things that create the market forces. Devices, software, programs, production processes, contracts, firms and markets are all the fruit of purposeful action; they are designed. Using the computer industry as an example, Carliss Y. Baldwin and Kim B. Clark develop a powerful theory of design and industrial evolution. They argue that the industry has experienced previously unimaginable levels of innovation and growth because it embraced the concept of modularity: building complex products from smaller subsystems that can be designed independently yet function together as a whole. Modularity freed designers to experiment with different approaches as long as they obeyed the established design rules. Drawing upon the literatures of industrial organization, real options, and computer architecture, the authors provide insight into the forces of change that drive today's economy.

A growing concern of mine has been the unrealistic expectations for new computer related technologies introduced into all kinds of organizations. Unrealistic expectations lead to disappointment and a schizophrenic approach to the introduction of new technologies. The UNIX and real time UNIX operating system technologies are major examples of emerging technologies with great potential benefits but unrealistic expectations. Users want to use UNIX as a common operating system throughout large segments of their organizations. A common operating system would decrease software costs by helping to provide portability and interoperability between computer systems in today's multivendor environments. Users would be able to more easily purchase new equipment and technologies and cost effectively reuse their applications. And they could more easily connect heterogeneous equipment in different departments without having to constantly write and rewrite interfaces. On the other hand many users in various organizations do not understand the ramifications of general purpose versus real time UNIX. Users tend to think of real time as a way to handle exotic heart monitoring or robotics systems. Then these users use UNIX for transaction processing and office applications and complain about its performance, robustness and reliability. Unfortunately the users don't realize that real time capabilities added to UNIX can provide better performance, robustness and reliability for these non real time applications. Many other vendors and users do realize this however. There are indications even now that general purpose UNIX will go away as a separate entity. It will be replaced by a real time UNIX. General purpose UNIX will exist only as a subset of real time UNIX.
