

Design of Concrete Structures - Part I

Answers

1. Write the assumption of the working stress method.

The working stress method (WSM) assumes that:

- The relationship between stress and strain is linear, meaning materials behave elastically.
- The factor of safety is applied to ensure that actual stresses remain within permissible limits.
- The structure is designed to resist service loads without any visible deformation or cracks.

2. Write the objectives of structural design.

The main objectives of structural design are:

- **Safety:** Ensure that the structure can carry applied loads without failure.
- **Serviceability:** Ensure the structure performs its intended function without excessive deformation, vibration, or cracking.
- **Durability:** Ensure the structure can withstand environmental and operational stresses throughout its design life.

3. What are the limitations of the working stress method of design?

The limitations of the WSM include:

- It doesn't consider material inelasticity or non-linear behavior.
- The method may be overly conservative, leading to excessive material use.
- It lacks consideration for failure modes under ultimate loads, unlike the Limit State Method.

4. Define characteristic strength and characteristic load.

- **Characteristic Strength:** The strength of a material below which not more than 5% of test results are expected to fall. For concrete, it is typically denoted as f_{ck} .
- **Characteristic Load:** The load value that has a 95% probability of not being exceeded during the life of the structure.

5. What are the different limit state methods of design?

The Limit State Method (LSM) includes:

- **Limit State of Collapse:** Ensures safety under maximum load conditions.
- **Limit State of Serviceability:** Ensures usability under normal service loads, controlling deflections, vibrations, and cracking.

6. Write the value of limiting depth of the neutral axis (NA) for different grades of steel.

- Limiting depth of the neutral axis (x_{lim}/d) varies with steel grade:
 - For Fe250: $x_{lim}/d = 0.53$

Design of Concrete Structures with Stress Fields Aurelio Muttoni, Joseph Schwartz, Bruno Thürlimann, 2012-12-06 17 2
STRESS FIELDS FOR SIMPLE STRUCTURES 2 1 INTRODUCTION In this chapter the behavior and strength of simple structures made of reinforced or prestressed concrete is investigated with the aid of stress fields In particular the webs and flanges of beams simple walls brackets bracing beams and joints of frames are investigated By this means the majority of design cases are already covered In reality all structural components are three dimensional Here however components are considered either directly as two dimensional plate elements i e the plane stress condition with no variation of stress over the thickness of the element or they are subdivided into several plates Since two dimensional structural elements are statically redundant it is possible for a particular loading to be in equilibrium with many theoretically an infinite number of stress states If the lower bound method of the theory of plasticity is employed then an admissible stress field or any combination of such stress fields may be selected In chapter 4 it is shown that this method is suitable for the design of reinforced concrete structures and the consequence of the choice of the final structural system on the structural behavior is dealt with in detail The first cases of the use of this method date back to Ritter 6 and Morsch 4 who already at the beginning of the century investigated the resultants of the internal stresses by means of truss models

PRACTICAL DESIGN OF REINFORCED CONCRETE STRUCTURES GHOSH, KARUNA MOY, 2010 This book is a comprehensive presentation of the practical aspects of analysis and design of reinforced concrete structures Written on the basis of the British BS and European Eurocode codes of practices this book is primarily meant for the undergraduate students of civil engineering It will also be

highly useful for structural engineers working in the fields of design consultancy and construction involving reinforced concrete structures The text is organized into four parts each dealing with the analysis and design of a specific type of reinforced concrete structure The first part covers the multi storeyed administrative office building The second part deals with the elevated storage bin structure used in steel plants The elevated structural framework subjected to mechanical vibration is the subject matter of the third part The fourth and final part discusses the precast reinforced concrete workshop building The important activities required to be carried out prior to structural analysis structural arrangement planning materials selection examination of buildability and environmental impact are covered in the initial chapters in each part This is followed by a step by step presentation of the analysis and design procedures for various structures and structural elements members The book presents the various structural analyses and design calculations in an exhaustive manner The text is illustrated with a large number of visuals Important additional information relevant to this field can be found in the references provided at the end of various chapters The STRAP structural analysis program for the multi storeyed administrative office building and the vibration analysis of the elevated reinforced concrete framed structure are provided in the Annexures to the book
