Handbook of Mammalian Vocalization Stefan M Brudzynski, 2009-12-08 Handbook of Mammalian Vocalization is designed as a broad and comprehensive but well balanced book written from the neuroscience point of view in the broad sense of this term This well illustrated Handbook pays particular attention to systematically organized details but also to the explanatory style of the text and internal cohesiveness of the content so the successive chapters gradually develop a consistent story without losing the inherent complexity Studies from many species are included however rodents dominate as most of the brain investigations were done on these species The leading idea of the Handbook

is that vocalizations evolved as highly adaptive specific signals which are selectively picked up by the brain. The brain serves as a receptor and behavioural amplifier. Brain systems will be described which allow vocal signals rapidly changing the entire state of the organism and trigger vital biological responses usually also with accompanying emission of vocalizations. Integrative brain functions leading to vocal outcome will be described along with the vocalization generators and motor output to larynx and other supportive motor subsystems. The last sections of the Handbook explain bioacoustic structure of vocalizations present understanding of information coding and origins of the complex semiotic semantic content of vocalizations in social mammals. The Handbook is a major source of information for professionals from many fields with a neuroscience approach as a common denominator. The handbook provides consistent and unified understanding of all major aspects of vocalization in a monographic manner and at the same time gives an encyclopaedic overview of major topics associated with vocalization from molecular cellular level to behavior and cognitive processing. It is written in a strictly scientific way but clear enough to serve not only for specialized researchers in different fields of neuroscience but also for academic teachers of neuroscience including behavioural neuroscience affective neuroscience clinical neuroscience neuroethology biopsychology neurolinguistics speech pathology and other related fields and also for research fellows graduate and other advanced students who widely need such a source publication. The first comprehensive handbook on what we know about vocalization in Mammals. Carefully edited the handbook provides an integrated overview of the area. International list of highly regarded contributors including Jaak Pankseep Washington State University David McFarland Oxford John D Newman NIH Unit on Developmental Neuroethology Gerd Poeppel Leipzig Shiba Keisuke Chiba City Japan and others tightly edited by a single well regarded editor who has edited a special issue in Behavioral Brain Research on the topic before.

Advances In Hearing Research - Proceedings Of The 10th International Symposium On Hearing H Fastl, G M Klump, C Koppl, Geoffrey A Manley, 1995-05-31. The main aim of the symposium on the hearing system is to provide a forum in which data ideas and models from both the physiological and psychoacoustical standpoints can be presented and discussed. Apart from those areas traditionally covered by such meetings two areas with important recent advances have been included viz development and regeneration. The present volume will be of interest to all scientists working in the field of auditory research.
