## Compiling Natural Semantics:

*Compiling Natural Semantics* Mikael Pettersson, 2005-11-20 Natural Semantics has become a popular tool among programming language researchers for specifying many aspects of programming languages. However, due to the lack of practical tools for implementation, the natural semantics formalism has so far largely been limited to theoretical applications. This book introduces the rational meta language RML as a practical language for natural semantics specifications. The main part of the work is devoted to the problem of compiling natural semantics actually RML into highly efficient code. For this purpose, an effective compilation strategy for RML is developed and implemented in the rml2c compiler. This compiler ultimately produces low level C code. Benchmarking results show that rml2c produced code is much faster than code resulting from compilers based on alternative implementation approaches.

**A Compiler for Natural Semantics** Mikael Pettersson, 1996 Abstract Natural semantics is a formalism used for specifying both semantics and implementations of programming languages. Until recently, no practical implementation of the formalism existed. We have defined the Relational Meta Language RML as an executable specification language for natural semantics. After a brief outline of the language, we describe the compilation strategy used by our rml2c compiler. Transformations are applied to minimize non-determinism, and a continuation passing style form is produced and simplified. Finally, the CPS is emitted as low level C code using an efficient technique for implementing tailcalls. We also present performance measurements that support our choice of compilation strategy.

**Lazy Evaluation: From natural semantics to a machine-checked compiler transformation** Breitner, Joachim, 2016-09-20 In order to solve a long standing problem with list fusion, a new compiler transformation Call Arity is developed and implemented in the Haskell compiler GHC. It is formally proven to not degrade program performance; the proof is machine checked using the interactive theorem prover Isabelle. To that end, a formalization of Launchbury's Natural Semantics for Lazy Evaluation is modelled in Isabelle, including a correctness and adequacy proof.
