# State-resolved studies of CO<sub>2</sub> sticking to CO<sub>2</sub> ice

Charlotte Jansen and Ludo B. F. Juurlink\*

Leiden Institute of Chemistry, Leiden University, Leiden, Netherlands

Internal vibrations may affect the adsorption, scattering, and reactions of molecules impinging onto a surface. The energy of the  $\nu_2$  antisymmetric stretch vibration of CO<sub>2</sub> slightly exceeds the desorption energy of CO<sub>2</sub> bound to CO<sub>2</sub> ice. We use supersonic molecular beam techniques and rovibrationally state-resolved excitation to determine whether this vibration affects condensation of gas phase CO<sub>2</sub> to its ice. We detect sticking and CO<sub>2</sub> ice formation using RAIRS and quantify the sticking probability using the King and Wells method with modulation of the vibrational excitation and Fourier transform based detection. We find that the influence of this vibration on the structure of the formed ice and on the sticking probability is negligible under our conditions. Based on our detection limit, we quantify the weighted average sticking probability at approximately 0.9 and the difference between the state-resolved and weighted average sticking probability as below 0.03%.

## 1 Introduction

Collisions of CO<sub>2</sub> with surfaces are of interest to a broad range of scientific fields. In astronomy and astrochemistry, CO<sub>2</sub> occurs, *a. o.*, in the interstellar medium (ISM) (d'Hendecourt and Jourdain de Mazaun, 1989), both in gaseous and ice phases (Van Dishoeck, 2004), and in comets (Despois *et al.*, 2005). In the chemical industry, CO<sub>2</sub> is a major reactant in the Cu/ZnO-based catalytic production of methanol (Rostrup-Nielsen, 1984). Collisions of CO<sub>2</sub> with surfaces are generally not reactive in a direct sense (Borghaus, 2014). Molecular sticking to a surface likely precedes subsequent chemical processes, especially at low-temperature conditions, such as those prevalent in interstellar space.

Molecular vibrations may affect the adsorption, desorption, and reactions of molecules to surfaces. Sibener and Lee (Sibener and Lee, 1994) found that internal vibrations of SF<sub>6</sub> and CCl<sub>4</sub> had a significant impact on the adsorption and reflection of these gas-phase molecules onto their bulk solids at low collision energies. In precursor-mediated reaction of CH<sub>4</sub> on Ir (111) (Dombrowski *et al.*, 2015) and SiH<sub>4</sub> on Si(100) (Bisson *et al.*, 2008), internal vibrations were found to enhance dissociative adsorption. A study of NO's trapping probability on Au (111) found, on the contrary, no effect of vibrational excitation (Wodtke *et al.*, 2005).

For CO<sub>2</sub>, a study by Weida *et al.* (Weida *et al.*, 1994) investigated CO<sub>2</sub> desorption from crystalline CO<sub>2</sub> ice at varying temperatures, hence varying desorption rates, using state-selected detection. They found no evidence of an effect on the desorption by the molecules' vibrations, rotations and even orientations. From detailed balance, they argued that if there is no preference for a certain quantum state for desorption, neither will there be for the process of adsorption. However, due to the limitations of their methods, only the  $\nu_2$  bend vibration in CO<sub>2</sub> was studied. Its vibrational energy (667 cm<sup>-1</sup> or 8.0 kJ/mol) is well below the desorption barrier, the sublimation energy being approximately 26 kJ/mol. The  $\nu_2$  fundamental
