*Advances in Research and Practice of Cyclodextrin Inclusion Complex* Miao Yanfei, 2021-07-29 Chemistry is a subject that makes human life better In the past few hundred years the development of modern chemistry has also explained this meaning perfectly Naturally supramolecular chemistry also needs to move from theory to application from laboratory to society and ultimately benefit mankind Insoluble drugs refer to poorly water soluble drugs which will lead to difficult absorption and transportation in vivo and low bioavailability About 40% of the newly discovered natural active substances and nearly 60% of the chemically synthesized drugs are insoluble drugs Their solubility in water is poor and it is difficult to achieve satisfactory clinical efficacy so they have not been successfully developed into new drugs Natural cyclodextrin can form supramolecular inclusion complexes with insoluble drugs thus increasing the solubility of insoluble drugs As a new drug delivery carrier it has been widely studied and applied Sulfobutyl ether cyclodextrin is a derivative of cyclodextrin Because of its good water solubility and biocompatibility sulfobutyl ether cyclodextrin can significantly increase the solubility bioavailability and low nephrotoxicity of drugs As a new type of injection drug delivery carrier it has become one of the hot spots in the research and development of new drugs at home and abroad

*Polysaccharide Materials* Kevin Edgar, Thomas Heinze, Charles Buchanan, 2009 Today we are experiencing a renaissance in the chemistry of polysaccharide materials This is due in part to recognition of the importance of renewable based materials in a society in which petroleum has become a much more expensive feedstock with a cloudy future with respect to adequacy of supply There are currently intense global efforts to develop a biomass based refinery process intended to produce biofuel ethanol or butanol being the top candidates that will replace some or all of the petroleum based fuel we now use In parallel scientists and non scientists have become aware of the opportunities that this biofuel industry will create for biomass based products The utilization of waste from the biofuel process along with the exploitation of the collection system for biomass that will serve the biofuel production process to make other products from biomass will create an unprecedented and revolutionary opportunity for the creation of integrated biorefineries These biorefineries will have substantial resemblance to current petroleum refineries in that they will convert a natural product or

more properly products into fuel by chemical transformations and separation processes and simultaneously use co products and main products as feedstocks for the production of more complex chemicals In order to take advantage of the opportunities presented by a biorefinery based economy it is crucial that we develop new synthetic methods for polysaccharide derivatives and new understanding of the structure property performance relationships of these versatile molecules This symposium series book will describe new synthetic methods novel polysaccharide derivatives new applications of these derivatives in biomedicine and packaging applications and numerous examples of the creation of new insight into the design of polysaccharide materials for performance The articles in this symposium series book are good examples of the advances in polysaccharide chemistry being made in the current renaissance that will help to move us towards a biorefinery future
