Cytokine Network:

The Cytokine Network Frances R. Balkwill, 2000 Cytokines are soluble mediators of intercellular communication They contribute to a chemical signalling language that regulates development tissue repair haemopoiesis inflammation and the immune response Potent cytokine polypeptides have pleiotropic activities and functional redundancy They act in a complex network where one cytokine can influence the production of and response to many other cytokines In the past five years this bewildering array of more than 100 effector molecules and associated cell surface receptors has been simplified by study of cytokine and cytokine receptor structure elucidation of convergent intracellular signalling pathways and molecular genetics and targeted gene disruption to knock out production of individual cytokines in mice It is also now clear that the pathophysiology of infectious autoimmune and malignant disease can be partially explained by the induction of cytokines and the subsequent cellular response Viral homologues exist for many cytokines and receptors and genetic variations in cytokine production may influence response to pathogenic stimuli Cytokine and cytokine antagonists have shown therapeutic potential in a number of chronic and acute diseases The Cytokine Network *Frontiers in Molecular Biology* is not a survey of individual cytokines but guides the reader through the latest research on the cytokine network as a whole covering genomics signalling pathways control of the immune response and therapeutics European Cytokine Network, 1999 The Cytokine Network Ziv Frankenstein, 2005 The Cytokine Network and Immune Functions Jacques Thèze, 1999 The great scientific progress in our understanding of the genetics chemistry biology and pathophysiology of the cytokines has made clear the need for a comprehensive discussion of these molecules as part of a unified system The Cytokine Network and Immune Functions provides just such a treatment It represents the efforts of many of the most prominent scientists studying these molecules Not only does it present a general discussion of each of the major cytokines or sets of cytokines it deals in detail with how these molecules affect all aspects of immune function and how they contribute to a wide range of pathological conditions As the title clearly indicates this book does not treat individual cytokines in isolation it recognizes that they act in a complex web of synergistic and counter regulatory effects so as to provide opportunities for the very fine control of immune responses Cytokine biology is not only a fascinating scientific discipline giving insight into how the immune and inflammatory systems are linked and regulated but also it is a subject of profound importance in modern medicine As the chapters in the section of this book entitled Cytokines in Pathology indicate virtually all insults to the organism be they acute or chronic call upon cytokine responses and virtually every disease entity has a component involving the function of cytokines In some diseases such as allergy and asthma and many of the autoimmune disorders abnormal cytokine responses are at the very heart of the disease process in others their impact may be more peripheral There can be no doubt however that the study of cytokine biology has contributed greatly to the growing power of molecular medicine transforming our approach to disease and building a new armamentarium of drugs and other treatments that promise to revolutionize our capacity to control a wide

Teich, 1997 This new edition maintains the objective of the previous editions of providing a relatively brief but comprehensive introduction to the initiation development and treatment of cancer Current techniques in cell and molecular biology have been widely applied to the study of cancer and the resulting new developments are introduced here In areas such as genetic and chromosome changes growth factors and the biology of human leukemia where there has been great activity the relevant chapters have been extensively rewritten but all the chapters have been reviewed and brought up to date **The Cytokine Handbook** Angus W. Thomson, 1994 This Second Edition of The Cytokine Handbook contains new chapters on recently characterized cytokines not previously covered in the First Edition The text continues to expand the coverage of specific cytokines serving as a valuable resource tool for immunologists pathologists and cancer cell biologists **Proteins** Robert Allen Meyers, 2007 **Cytokines** Frances R. Balkwill, 1995 Cytokines are proteins that control communications between cells in the body and are important in immunity inflammation tissue development tissue repair and cancer This comprehensive guide describes the various research methods

used to study cytokines

Bacteria-cytokine Interactions in Health and Disease Brian Henderson, Stephen Poole, Michael Wilson, 1998 This volume brings together the current literature on bacterial virulence and on cytokines to produce a synthesis that attempts to explain how infectious and commensal bacteria interact with man An explanation is provided for this failure to respond to normal microflora

Cytokines in Cancer Therapy Frances R. Balkwill, 1989 Cytokines a broad class of proteins have a role in fighting infection and in mounting an immune response in mediating cell differentiation and embryogenesis in promoting cell growth and in inhibiting growth or causing cell death Recent advances in cell culture monoclonal antibodies and recombinant DNA technology have made it possible to isolate these proteins and to obtain sufficient quantities to conduct clinical studies as well as laboratory experiments Thus the foundations have been laid for a new form of cancer therapy and for understanding how abnormalities in the cytokine network could contribute to the process of malignancy Up to date and comprehensive this book brings together current research and discusses it in the context of its present and potential clinical application The book is intended for cancer researchers clinical oncologists and those involved in the pharmaceutical and biological product industries

Cancer and Inflammation Derek J. Chadwick, Jamie A. Goode, 2004-03-05 Chronic inflammation predisposes to some forms of cancer and the host response to malignant disease shows several parallels with

inflammation and wound healing The cells involved in inflammation are detected in a range of common cancers together with the inflammatory cytokines and members of the chemokine ligand receptor systems Neutralization or deletion of the gene for some inflammatory cytokines confers resistance to tumour induction and experimental metastasis Over expression of such cytokines in tumour cells may enhance malignant potential Certain chemokines are likely to subvert antitumour immunity by favouring development of ineffective Type 2 responses Tumour cells may even utilize chemokine receptors in homing to lymph nodes and other organs Thus the cells cytokines and chemokines found in tumours are more likely to contribute to tumour growth progression and immunosuppression than they are to mount an effective host antitumour response This book draws together contributions from an international group of scientists and clinicians from diverse disciplines ranging from epidemiology to immunology cell biology molecular oncology molecular medicine and pharmacology to debate these and related issues Topics covered include the epidemiological links between cancer and inflammation the parallels between inflammation and cancer the role of inflammation in cancer inflammatory genes as risk factors for cancer initiation and progression inflammation and cancer angiogenesis and preventative and therapeutic strategies Related Novartis Foundation symposia 252 Generation and effector functions of regulatory lymphocytes Chair Jean Fran ois Bach Immunoinformatics bioinformatic strategies for better understanding of immune function Chair Hans Georg Rammensee
