Control of Nonlinear Distributed Parameter Systems With Application to Flow Control ,1992 The goal of this project was to put the intuitive idea of gain scheduling on a rigorous foundation for a class of nonlinear distributed parameter systems This involved a study of the existence and characterization of the ideal infinite dimensional feedback control Since in most applications the feedback function cannot be computed in closed form it was necessary to study the convergence of approximate feedback functions based on increasingly higher order finite dimensional approximations of the system to the ideal function Finally the results were applied to Burgers Equation which can be viewed as a low order approximation to a wide variety of physical phenomena including viscous compressible flow *Optimal Control of a Class of Nonlinear Distributed Parameter Systems* Tian-Shen Tang,1990 *Spatio-Temporal Modeling of Nonlinear Distributed Parameter Systems* Han-Xiong Li,Chenkun Qi,2011-02-24 The purpose of this volume is to provide a brief review of the previous work on model reduction and identification of distributed parameter systems DPS and develop new spatio temporal models and their relevant identification approaches In this book a systematic overview and classification on the modeling of DPS is presented first which includes model reduction parameter estimation and system identification Next a class of block oriented nonlinear systems in traditional lumped parameter systems LPS is extended to DPS which results in the spatio temporal Wiener and Hammerstein systems and their identification methods Then the traditional Volterra model is extended to DPS which results in the spatio temporal Volterra model and its identification algorithm All these methods are based on linear time space separation Sometimes the nonlinear time space separation can play a better role in modeling of very complex processes Thus a nonlinear time space separation based neural modeling is also presented for a class of DPS with more complicated dynamics Finally all these modeling approaches are successfully applied to industrial thermal processes including a catalytic rod a packed bed reactor and a snap curing oven The work is presented giving a unified view from time space separation The book also illustrates applications to thermal processes in the electronics packaging and chemical industry This volume assumes a basic knowledge about distributed parameter systems system modeling and identification It is intended for researchers graduate students and engineers interested in distributed parameter systems nonlinear systems and process modeling and control **Control and Estimation of Distributed Parameter Systems: Nonlinear Phenomena** Wolfgang Desch,Franz Kappel,Karl Kunisch,2011-09-30 22 papers on control of nonlinear partial differential equations highlight the area from a broad variety of viewpoints They comprise theoretical considerations such as optimality conditions relaxation or stabilizability theorems as well as the development and evaluation of new algorithms A significant part of the volume is devoted to applications in engineering continuum mechanics and population biology **Recent Advances in Control of Nonlinear and Distributed Parameter Systems, Robust Control, and Aerospace Control Applications** ,1988 Control of Distributed Parameter Systems S. Identification and Control of Non-linear Distributed Parameter Systems Satyam Godasi, 2002

Applied Optimal Control Theory of Distributed Systems K.A. Lurie, 2013-11-21 This book represents an extended and substantially revised version of my earlier book *Optimal Control in Problems of Mathematical Physics* originally published in Russian in 1975 About 60% of the text has been completely revised and major additions have been included which have produced a practically new text My aim was to modernize the presentation but also to preserve the original results some of which are little known to a Western reader The idea of composites which is the core of the modern theory of optimization was initiated in the early seventies The reader will find here its implementation in the problem of optimal conductivity distribution in an MHD generator channel flow Since then it has emerged into an extensive theory which is undergoing a continuous development The book does not pretend to be a textbook neither does it offer a systematic presentation of the theory Rather it reflects a concept which I consider as fundamental in the modern approach to optimization of distributed systems Bibliographical notes though extensive do not pretend to be exhaustive as well My thanks are due to Professor Jean Louis Armand and Professor Wolf Stadler whose friendly assistance in translating and polishing the text was so valuable I am indebted to Mrs Kathleen Durand and Mrs Colleen Lewis for the hard job of typing large portions of the manuscript

Control Oriented Nonlinear Model Reduction for Distributed Parameter Systems Samir S. Sahyoun, 2017 The development of model reduction techniques for physical systems modeled by partial differential equations PDEs has been a very active research area Large number of states is needed to accurately capture the dynamics of such systems which makes them unsuitable for control design The order of the system must be reduced prior to control design In this dissertation new methods that generalize the popular proper orthogonal decomposition POD to nonlinear PDEs are investigated In particular cluster based POD algorithms are developed and applied to the one and two dimensional Burgers equations that govern a nonlinear convective flow Each cluster contains relatively close in distance dynamic behavior within itself and considerably far with respect to other clusters Three different clustering schemes in time space and space time are proposed A complete and detailed approach for the Orthogonal Locality Preserving Projections OLPP modes computation for the incompressible Navier Stokes PDE that governs the dynamics of the NACA 0015 airfoil fluid flow

is presented Close snapshots in the full order model are forced to stay close in the reduced order model by defining an optimization problem that preserves local distances Optimal boundary control laws are derived based on the proposed nonlinear reduced order models and applied to various distributed parameter systems including Nonlinear convection temperature control in energy efficient buildings systems governed by the heat equation power and voltage control in large electromechanical oscillations in the power grid governed by the wave equation and flow separation control for fluid flows governed by the Navier Stokes equations
