Bharucha-Reid, 2014-05-10 *Probabilistic Analysis and Related Topics Volume 1* focuses on the continuity differentiability and integrability of random functions including functional analysis operator theory measure theory and numerical analysis The selection first offers information on stochastic partial differential equations in turbulence related problems and estimation and stochastic control for linear infinite dimensional systems Discussions focus on deterministic quadratic cost control problem partial differential equations in stochastic wave propagation and theory of stochastic partial differential equations The text then examines random integrodifferential equations including small perturbations existence and uniqueness of solutions stochastic properties of solution processes and vibration string The manuscript ponders on equivalence and singularity of Gaussian measures and applications and stochastic Riemannian geometry Concerns include semilocal properties Brownian motion reproducing kernel Hilbert spaces and Gaussian processes equivalence and singularity of Gaussian processes and general problem of equivalence and singularity The selection is a vital source of information for mathematicians and researchers interested in the general theory of random functions **Optimization and Discrete Choice in Urban Systems** Bruce G. Hutchinson, Peter Nijkamp, Michael Batty, 2012-12-06 The papers contained in this volume were originally presented at the International symposium on New Directions in Urban Systems Modelling held at the University of Waterloo in July 1983 The papers have been reviewed and rewritten since that time The exception is the introductory paper written specially by Manfred Fischer and Peter Nijkamp as an introduction to this volume The manuscript was prepared in the word processing unit in the department of Civil Engineering university of Waterloo The sustained work of Mrs I Steffler in preparing this manuscript is gratefully acknowledged R K Kumar provided excellent assistance with the editorial process The symposium and the preparation of this manuscript were supported financially by the Natural Sciences and Engineering Research Council of Canada The Academic Development Fund and the Department of Civil Engineering University of Waterloo **TABLE OF CONTENTS** PREFACE III Categorical Data and Choice Analysis in a Spatial Context Manfred Fischer and Peter Nijkamp **Introduction to the Theory of Matroids** R. v. Randow, 2012-12-06 Matroid theory has its origin in a paper by H

Whitney entitled On the abstract properties of linear dependence 35 which appeared in 1935 The main objective of the paper was to establish the essential abstract properties of the concepts of linear dependence and independence in vector spaces and to use these for the axiomatic definition of a new algebraic object namely the matroid Furthermore Whitney showed that these axioms are also abstractions of certain graph theoretic concepts This is very much in evidence when one considers the basic concepts making up the structure of a matroid some reflect their linear algebraic origin while others reflect their graph theoretic origin Whitney also studied a number of important examples of matroids The next major development was brought about in the forties by R Rado s matroid generalisation of P Hall s famous marriage theorem This provided new impulses for transversal theory in which matroids today play an essential role under the name of independence structures of the treatise on transversal theory by L Mirsky 26J At roughly the same time R P Dilworth established the connection between matroids and lattice theory Thus matroids became an essential part of combinatorial mathematics About ten years later W T Tutte 30 developed the fundamentals of matroids in detail from a graph theoretic point of view and characterised graphic matroids as well as the larger class of those matroids that are representable over any field

**Variable Structure Systems with Application to Economics and Biology** R. R. Mohler, A. Ruberti, 2012-12-06 The proceedings of the Second US Italy Seminar on Variable Structure Systems is published in this volume Like the first seminar its conception evolved from common research interests on bilinear systems at the Istituto di Automatica of Rome University and at the Electrical and Computer Engineering Department of Oregon State University Again the seminar was focused on variable structure systems in general In this case however emphasis is given to applications in biology and economics along with theoretical investigations which are so necessary to establish a unified theory and to motivate further developments in these applications of social significance By bringing together the talents of social and biological scientists with those of engineers and mathematicians from throughout Italy and the United States the seminar was intended to yield a cross pollination of significant results and a base for more meaningful future research The editors are encouraged by the progress with which they hope the reader will agree is made in this direction No pretense is made however that completely satisfactory integration of theoretical results and applications has been accomplished at this time Among the more important conclusions which have resulted from this seminar are that bilinear and more general variable structure models arise in a natural manner from basic principles for certain biological and economic processes
