Control Of Large Flexible Space Structures:

Control of Large Flexible Space Structures Suresh M. Joshi, 2014-03-12 This book is a research monograph that addresses the basic issues in controlling large flexible space structures LFSS and presents some controller synthesis methods developed by the author The main problem considered is that of controller synthesis for precision attitude control and vibration suppression in LFSS The bulk of the book presents two basic approaches for controller synthesis 1 a class of dissipative controllers which utilize collocated actuators and sensors and 2 a class of model based compensators The book will serve to stimulate research activity in control theory with application to LFSS and will be very useful to researchers practising engineers academic faculty and students in control and aerospace sciences The background required of the reader is familiarity with basic control theory including state variable methods which is generally attained at the first year postgraduate level

Active Control of Large Flexible Space Structures Michael Keith Mackay, 1983 *The Dynamics and Control of Large Flexible Space Structures*, 1985 **The Dynamics and Control of Large Flexible Space Structures** National Aeronautics and Space Administration (NASA), 2018-08-06 The dynamics and attitude and shape control of very large inherently flexible spacecraft systems were investigated Increasingly more complex examples were examined beginning with a uniform free free beam next a free free uniform plate platform and finally by considering a thin shallow spherical shell structure in orbit The effects devices were modeled For given sets of assumed actuator locations the controllability of these systems was first established Control laws for each of the actuators were developed based on decoupling techniques including distributed modal control pole placement algorithms and an application of the linear regulator problem for optical control theory Bainum P M and Krishna R and Kumar V K and Reddy A S S R Unspecified Center NASA CR 164982 NSG 1414

boundary conditions A parametric study examined the consequences of varying the number of design parameters and the number of specified boundary conditions Study results include 1 Additional degrees of freedom reduce the curvature of the trajectory reduce the peak maneuver angle rate and only slightly increase the peak rigid body torques on the structure during slewing maneuvers 2 Additional boundary conditions result in smoother transitions at the end points between targeting maneuvers and increase the peak maneuver angle rate and rigid body torques by a larger percentage than do additional design parameters Next planar dynamics equations of motion for a uniform inextensible cantilevered beam capable of small transverse deformations and which retain the rotational centrifugal nonlinearities are derived via Newton's Laws nondimensionalized and cast into a form suitable for numerical integration

Incorporating Control Into the Optimal Structural Design of Large Flexible Space Structures T. V.

Muckenthaler,AIR FORCE INST OF TECH WRIGHT-PATTERSON AFB OH SCHOOL OF ENGINEERING.,1984 An eigenspace optimization approach is used to incorporate optimal control into the structural design process for large flexible space structures The equations of motion for an uncontrolled system are developed by deriving the kinetic and potential energy for the system and then using assumed modes to discretize the energies These expressions are then linearized the Lagrangian formed and lagrange equations written for the system An existing optimal control law is incorporated to form the equations of motion for the controlled system A parameter optimization technique is used to minimize the mass of the Draper RPL configuration model involving eigenspace optimization A computer algorithm is developed that effectively optimizes a global structural parameter vector to minimize the mass of the model while constraining specified eigenvalues The eigenvalue sensitivities are passed to a constrained function minimization program called CONMIN which minimizes the mass of the appendages The constraints imposed restrict the first eigenvalue to the left half plane and the natural frequency of the third eigenvalue to a specified stable region The result is an algorithm that incorporates an existing optimal control law into the structural optimization process Originator supplied keywords included Flexible Space Structures Eigenspace Optimization Equations of Motion Draper RPL Configuration Model Theses *Large Space Structures & Systems in the Space Station Era*,1990
