## **Control Using Logicbased Switching:**

Control Using Logic-Based Switching ,1995 Between the well studied areas of discontinuous control on the one hand and sampled data control on the other lies the largely unexplored area of logic based switching control systems By a logic based switching controller is meant a controller whose subsystems include not only familiar dynamical components integrators summers gains etc but logic driven elements as well More often than not the predominately logical component within such a system is called a supervisor a mode changer a gain scheduler or something similar Within the last decade a number of analytical studies of such systems have emerged mainly in the area of self adjusting control These studies and others have shown that much can be gained by using logic based switching together with more familiar techniques in the synthesis of feedback controls The overall models of systems composed of such logics together with the processes they are intended to control are concrete examples of hybrid dynamical systems The paper gives a brief tutorial review of four different classes of hybrid systems of this type each consists of a continuous time process to be controlled a parameterized family of candidate controllers and an event driven switching logic Three of the logics called prerouted switching hysteresis switching and dwell time switching respectively are simple strategies capable of determining in real time which candidate controller should be put in feedback with a process in order to achieve desired closed loop performance The fourth called cyclic switching has been devised to solve the long standing stabilizability problem which arises in the synthesis of identifier based adaptive controllers because of the existence of points in parameter space where the estimated model upon which certainty equivalence synthesis is based loses stabilizability

**Control Using Logic-Based Switching** A.Stephen Morse,1997 A logic based switching controller is one whose subsystems include not only familiar dynamical components such as integrators summers gains etc but event driven logic and associated switches as well In such a system the predominantly logical component is the supervisor mode changer etc There has been growing interest in recent years in determining what could be gained from utilising hybrid controllers of this type To this end a workshop was held on Block Island with the aim of bringing together individuals to discuss the research and common interest in the field This volume not only includes contributions from those who were present at Block Island but also additional material from those who were not Topics covered include hybrid dynamical systems control of hard bound constrained and nonlinear systems automotive problems involving switching control and system control in the face of large scale modeling errors

Antsaklis,Wolf Kohn,Michael Lemmon,Anil Nerode,Shankar Sastry,2003-07-31 This book constitutes the strictly refereed post proceedings of the 5th International Hybrid Systems Workshop held in Notre Dame Indiana USA in September 1998 The 23 revised full papers presented in the book have gone through two rounds of thorough reviewing and revision The volume presents state of the art research results and particularly addresses such areas as program verification concurrent and distributed processes logic programming logics of programs discrete event simulation calculus of variations optimization differential geometry Lie
