**Grid Computing** Pawel Plaszczak, Richard Wellner Jr., 2005-09-26 A decade ago the corporate world viewed grid computing as a curiosity Today it views it as an opportunity a chance to reduce costs improve performance fund new projects and take advantage of under utilized capacity The engineering behind this transformation has been amply documented Until now however little has been written to prepare managers executives and other decision makers to implement grid computing in a sensible and effective way Grid Computing The Savvy Manager's Guide examines the technology from a rigorous business perspective equipping you with the practical knowledge you need to assess your options and determine what grid computing approach is right for your enterprise This book is heavy on real world experience distilling from a rich assortment of case studies the best practices currently at work in a variety of industries Always attentive to grid computing's many competitive advantages it is also realistic about the challenges of selling the idea to staff and making it a part of your company's culture Sketches the history of grid computing showing how it made the leap from academia to business Examines the criteria you'll need to meet to make your network grid enabled Explains how a grid based solution can be made to meet key organizational requirements including security scheduling data storage and fault tolerance Surveys the approaches currently available and helps you choose the one that will best meet your

for changes in the way these systems are built and managed As a consequence a paradigm shift towards Model Driven Engineering and Policy Based Management can be observed both aiming at a better management of complexity A lot of human effort is still necessary to develop and operate complex systems In this thesis an innovative approach to reduce that effort is presented Domain specific models are used to describe the IT system and its behavior at a high level of abstraction initially They are refined into technical representations at lower levels and finally transformed into event condition action policies These executable policies define which actions must or must not be performed to achieve the objectives of the system The refinement of models and the generation of policy implementations are both fully automated As high level changes are automatically materialized in the respective policies system behavior can be adapted at runtime simply by changing the high level models This allows to operate even complex systems without considering their technical details Finally the correctness of the refinement is proven with a relational algebra The benefits of the approach are demonstrated and evaluated with two real world case studies dealing with the management of mobile networks and the calculation of bonus payments
