

Active air sampling vs passive air sampling

Active air sampling

Shorter sampling time

Detects bacterial presence in low concentrations

Costs associated with equipment and personnel training

Allows for qualitative and quantitative analyses of the samples

Allows for collection and analysis of high number of samples throughout the facility

Air sampler draws in controlled volumes of air

Passive air sampling

Longer sampling time, due to which agar might dry

Detects only the bacteria that sediments onto agar plates, and might miss bacteria present in lower concentrations

Lower cost associated with tests

Allows only qualitative analysis of the sample

Amount of samples are directly proportional to the number of petri dishes placed around the facility

Results are dependent upon air flow dynamics in and around test areas
