Computer simulation of economic systems *...an example model*

EARL SASSER is a research associate with the Econometric System Simulation Program at Duke University. He received his undergraduate degree in mathematics from Duke University and his MBA from the University of North Carolina. At present he is a candidate for the PhD degree in Economics at Duke University.

Mr. Sasser was formerly employed by West Virginia Pulp and Paper Company, Charleston, South Carolina, in the commercial analysis department. He still maintains his contact with industry as a part-time management consultant.

During the summer of 1966 Mr. Sasser and Professor W. H. Wallace of ESSP devoted their time to developing an econometric model of the U. S. textile industry. Mr. Sasser is now conducting simulation experiments with this model to test the effects of various managerial and governmental policy decisions on the behavior of the textile industry.

THOMAS H. NAYLOR, Associate Professor of Economics and co-director of the Econometric System Simulation Program at Duke University, received a BS degree in mathematics from Millsaps College, a BS in industrial engineering from Columbia University, and an MBA from Indiana University prior to completing his PhD in economics at Tulane University. Before joining the faculty at Duke where he teaches econometrics, operations research, and mathematical economics, he was an instructor in the School of Business Administration at Tulane. He has also worked for Sun Oil Company, International Paper Company, and Dow Chemical Company.

Dr. Naylor is coauthor of *Computer Simulation Techniques* published by John Wiley & Sons in 1966, as well as a number of papers related to the economic theory of the form and design of simulation experiments. He is currently engaged in a project entitled "The Design of Computer Simulation Experiments for Economic Systems" which is supported by the National Science Foundation. Dr. Naylor is a member of the Institute of Management Sciences, the Econometric Society, the American Economic Association, the American Statistical Association, and SCl.

INTRODUCTION

With the publication in recent years of such important works as Cyert and March's¹ behavioral models of the firm, Cohen's² computer model of the shoe, leather, hide sequence, Orcutt's³ demographic model of the United States, and the Brookings-SSRC Quarterly Econometric Model of the United States⁴, the potential of computer simulation as a tool of economic analysis has become increasingly evident. The objective of this paper is to provide a rationale for the use of computer simulation in economics and to outline a general methodology for planning and implementing computer simulation experiments with economic systems. With the aid of an example model we shall describe the actual process of simulating an economic system—paying particular attention to the techniques used, problems encountered, and results obtained. This will be followed by a cursory description of several existing computer simulation models of economic systems. By indicating the wide spectrum of previous applications, we hope to increase the reader's awareness of the potential uses of simulation in economics.

A RATIONALE FOR COMPUTER SIMULATION

For our purposes, we shall define simulation as a numerical technique for conducting experiments on certain types of mathematical and logical models describing the behavior of an economic system (or some component thereof) on a digital computer over extended periods of real time.

In general, the principal motivation for using simulation in economics is the pursuit of scientific knowledge about the behavior of economic systems. When applied to eco-

Krutilla, 2013-11-26 First Published in 2011 This is Volume 10 of in a set of ten titles on Resources for the Future Library Collection Forests Lands and Recreation The research on which this monograph is based was stimulated by some ideas presented in George Stankey's A Strategy for the Definition and Management of Wilderness Quality and the conceptual model presented in a paper by Anthony Fisher and John Krutilla entitled Determination of Optimal Capacity of Resource Based Recreation Facilities This study explores in an effort to develop operational means of determining optimal capacity of intended low density recreation facilities was 1 to establish the empirical relation between the benefits enjoyed during a wilderness outing as a function among other things of the number of other parties encountered and 2 a means of estimating the expected frequency of encounters as a function of the intensity of use of any wilderness area

Computer Simulations and the Changing Face of Scientific Experimentation Eckhart Arnold, Juan M. Durán, 2013-07-16 Computer simulations have become a central tool for scientific practice Their use has replaced in many cases standard experimental procedures This goes without mentioning cases where the target system is empirical but there are no techniques for direct manipulation of the system such as astronomical observation To these cases computer simulations have proved to be of central importance The question about their use and implementation therefore is not only a technical one but represents a challenge for the humanities as well In this volume scientists historians and philosophers join to examine computer simulations in scientific practice One central aim of the volume is to provide a multi perspective view on the topic Therefore the text includes philosophical studies on computer simulations as well as case studies from simulation practice and historical studies of the evolution of simulations as a research method The theoretical studies in this book discuss the epistemological relation between simulations and experiments as well as the empirical or non

empirical status of data resulting from computer simulations The role of simulations in current scientific practice is examined in the cases of astronomy system biology nanoscale research and in the pharmaceutical industry The historical perspective is brought in by examining the rise of supercomputing as well as the exploding number of published simulation studies in some scientific fields The book concludes with critical reflections on the potential limitations and failures of computer simulations
