Computers Chess And Long Range Planning:

Computers, Chess and Long-Range Planning Michail M. Botvinnik,2012-12-06 Mihail Moiseevich Botvinnik is an electrical engineer by profession during World War II he headed a high tension laboratory in the Urals and was decorated by the USSR for his accomplishments At present he is the head of the alternating current machine laboratory at the Moscow Institute of Power Engineering He is also a world renowned chess player He was born in 1911 and by 1935 had become a Grandmaster of Soviet chess In 1948 he won the world chess championship and held the title until 1963 except for a two year break His chess style has been characterized as deep objective serious and courageous In this book the quality of his thinking is revealed in his study of the basic thought processes of master chess players and his reduction of these processes to mathematical form This formalization of thought processes is a contribution to science at three levels at the immediate level it provides a basis for a computer program that seems likely to succeed in playing chess at the middle level game playing programs help us to study and rationalize the processes of planning and decision making and at the highest level the study of the mind in action as in the game of chess leads to an understanding of human thought and of the human psyche

Computers, Chess and Long-Range Planning Michail M Botvinnik,Arthur Brown,1970-07-08 **All About Chess and Computers** D. Levy,M. Newborn,2012-12-06 For some time now I have felt that the time is right to write a book about Computer Chess Ever since the first attempts at chess programming were made some twenty five years ago interest in the subject has grown from year to year During the late 1950s the subject was first brought to the attention of the public by an article in Scientific American and less than a decade later a chess program was competing in a tournament with humans More recently there have been tournaments in which the only participants were computer programs and when the first World Computer Championship was held in Stockholm in 1974 the event was an outstanding success Laymen often doubt the value of investing in a subject so esoteric as computer chess but there is definitely considerable benefit to be gained from a study of the automisation of chess and other intellectual games If it proves possible to play such games well by computer then the techniques employed to analyse and assess future positions in these games will also be useful in other problems in long range planning I have tried to make this book both interesting and instructive Those who understand anything at all about chess but who have no knowledge of computers will be able to follow my description of how computers play chess Those with a knowledge of both areas will still find much to interest them Computers in Chess M. M. Botvinnik,2013-12-12 Much water has flowed over the dam since this book went to press in Moscow One might expect that PIONEER would have made substantial advances unfortunately it has not There are reasons the difficulty of the problem the disenchantment of the mathematicians because of the delays and drawing out of the work and principally the insufficiency and some times complete lack of machine time The general method used by PIONEER to solve complex multidimensional search problems had already been formulated at that time It was supposed that the successful completion of the chess program PIONEER I would provide

a sufficient validation for the method We did not succeed in completing it But unexpectedly PIONEER s method obtained a different kind of validation Since our group of mathematicians works at the Institute for Electroenergy we were invited to solve some energy related problems and were assigned the task of constructing a program that would plan the reconditioning of the equipment in power stations initially for one month Until then the technicians had been preparing such plans without the aid of computers Although the chess program was not complete even after ten years the program PIONEER 2 for computing the monthly repair schedule for the Interconnected Power System of Russian Central was completed in a few months In mid October of 1980 a medium speed computer constructed the plan in 40 seconds When at the end of the month the mathematician A

Perspectives on Computer Science Anita K. Jones,2014-06-17 *Perspectives on Computer Science* provides information pertinent to the fundamental aspects of computer science This book discusses the weaknesses frequently found in minicomputers Organized into 12 chapters this book begins with an overview of the technological economic and human aspects of the environment in which PDP 11 was designed and built This text then examines the set of techniques for tree searching Other chapters consider a tutorial on automatic planning systems with emphasis given to knowledge representation issues This book discusses as well the classical least fixedpoint approach toward recursive programs and examines the interplay between time and space determined by a variety of machine models The final chapter deals with some of the primary influences in contemporary programming language design namely programming methodology program specification verification and formal semantic definition techniques This book is a valuable resource for students and teachers Computer science theoreticians and mathematicians will also find this book useful

Canadian Mathematical Bulletin,1972-06 *How Not to Network a Nation* Benjamin Peters,2016-03-25 How despite thirty years of effort Soviet attempts to build a national computer network were undone by socialists who seemed to behave like capitalists Between 1959 and 1989 Soviet scientists and officials made numerous attempts to network their nation to construct a nationwide computer network None of these attempts succeeded and the enterprise had been abandoned by the time the Soviet Union fell apart Meanwhile ARPANET the American precursor to the Internet went online in 1969 Why did the Soviet network with top level scientists and patriotic incentives fail while the American network succeeded In *How Not to Network a Nation* Benjamin Peters reverses the usual cold war dualities and argues that the American ARPANET took shape thanks to well managed state subsidies and collaborative research environments and the Soviet network projects stumbled because of unregulated competition among self interested institutions bureaucrats and others The capitalists behaved like socialists

while the socialists behaved like capitalists After examining the midcentury rise of cybernetics the science of self governing systems and the emergence in the Soviet Union of economic cybernetics Peters complicates this uneasy role reversal while chronicling the various Soviet attempts to build a unified information network Drawing on previously unknown archival and historical materials he focuses on the final and most ambitious of these projects the All State Automated System of Management OGAS and its principal promoter Viktor M Glushkov Peters describes the rise and fall of OGAS its theoretical and practical reach its vision of a national economy managed by network the bureaucratic obstacles it encountered and the institutional stalemate that killed it Finally he considers the implications of the Soviet experience for today s networked world

The Psychology of Chess Skill Dennis H. Holding, 2021-10-07 Both chess play and psychological research offer rewards to their participants in the form of intellectual satisfaction It seems to follow that combining these two forms of activity by carrying out research into chess play should be a particularly engaging enterprise In the mid 1980s enough was now known for it to be feasible to tell a reasonably satisfying story by piecing together the accumulated results of experiments on chess There were remaining gaps in knowledge but the structure of chess skill had at least become sufficiently evident to exhibit where the gaps lay Originally published in 1985 this book was an attempt to summarize the progress that had been made at the time recounting some of the components of the research process while describing how the chessplayer seems to think imagine and decide

Chess Skill in Man and Machine P. W. Frey, 2012-12-06 Ten years of intensive effort on computer chess have produced notable progress Although the background information and technical details that were written in 1975 for the first edition of this book are still valid in most essential points hardware and software refinements have had a major impact on the effectiveness of these ideas The current crop of chess machines are performing at unexpectedly high levels The approach epitomized by the series of programs developed by David Slate and Larry Atkin at Northwestern in the middle 1970s i e a sophisticated search algorithm using very little chess knowledge was expected to reach an asymptotic level of performance no higher than that of a class A player USCF rating between 1800 and 2000 This perspective was argued quite vigorously by Eliot Hearst in Chapter 8 of the first edition and was held at that time by many chess experts Subsequent events have clearly demonstrated that the asymptotic performance level for this type of program is at least as high as the master level USCF rating between 2200 and 2400 Current discussions now focus upon whether the earlier reservations were wrong in principle or simply underestimated the asymptote If there is a real barrier which will prevent this type of program from attaining a world championship level of performance it is not evident from the steady progress which has been observed during the last decade
