Computational Plasticity In Powder Forming Processes:

Computational Plasticity in Powder Forming Processes Amir Khoei, 2010-07-07 The powder forming process is an extremely effective method of manufacturing structural metal components with high dimensional accuracy on a mass production basis The process is applicable to nearly all industry sectors It offers competitive engineering solutions in terms of technical performance and manufacturing costs For these reasons powder metallurgy is developing faster than other metal forming technology Computational Plasticity in Powder Forming Processes takes a specific look at the application of computer aided engineering in modern powder forming technologies with particular attention given to the Finite Element Method FEM FEM analysis provides detailed information on conditions within the processed material which is often more complete than can be obtained even from elaborate physical experiments and the numerical simulation makes it possible to examine a range of designs or operating conditions economically Describes the mechanical behavior of powder materials using classical and modern constitutive theories Devoted to the application of adaptive FEM strategy in the analysis of powder forming processes 2D and 3D numerical modeling of powder forming processes are presented using advanced plasticity models

Advanced Computational Materials Modeling Miguel Vaz Junior, Eduardo A. de Souza Neto, Pablo A. Munoz-Rojas, 2010-12-06 With its discussion of strategies for modeling complex materials using new numerical techniques mainly those based on the finite element method this monograph covers a range of topics including computational plasticity multi scale formulations optimization and parameter identification damage mechanics and nonlinear finite elements

International Journal of Powder Metallurgy, 2000 *Computational Modelling of Forming Processes*, 2001 *Material Forming Processes* Anne Marie Habraken, 2003 The various contributors to this work cover practical techniques such as injection molding composites forming die extrusion hydro forming blowing forging machining and cutting super plastic forming as well as a number of other specific processes In addition they write about more theoretical treatments including the advection equation in forming processes damage modeling inverse modeling dedicated to rheology parameter identification micro macro modeling and no local and gradient models The diverse materials considered include composites metals polymers and even wood and bones The chapters have been written by specialists from different scientific disciplines that come from industry and academia and their contributions have been adapted from the proceedings of the 4th International Conference on Material Forming held in Lihge Belgium in April 2001 *The British National Bibliography* Arthur James Wells, 2005 **Kona**, 2007 *Computational Plasticity* Eugenio Oñate, Roger Owen, 2010-03-25 Despite the apparent activity in the field the ever increasing rate of development of new engineering materials required to meet advanced technological needs poses fresh challenges in the field of constitutive modelling The complex behaviour of such materials demands a closer interaction between numerical analysts and material scientists in order to produce thermodynamically consistent models which provide a response in keeping with fundamental micromechanical principles and experimental observations This necessity for collaboration is further highlighted by the continuing remarkable developments in computer hardware which makes the numerical simulation of complex deformation responses increasingly possible This book contains 14 invited contributions written by distinguished authors who participated in the VIII International Conference

on Computational Plasticity held at CIMNE UPC www.cimne.com from 5-8 September 2005 Barcelona Spain The meeting was one of the Thematic Conferences of the European Community on Computational Methods in Applied Sciences ECCOMAS www.eccomas.org The different chapters of this book present recent progress and future research directions in the field of computational plasticity A common line of many contributions is that a stronger interaction between the phenomenological and micromechanical modelling of plasticity behaviour is apparent and the use of inverse identification techniques is also more prominent The development of adaptive strategies for plasticity problems continues to be a challenging goal while it is interesting to note the permanence of element modelling as a research issue Industrial forming processes geomechanics steel and concrete structures form the core of the applications of the different numerical methods presented in the book
