E - Learning Modules Dan Ryan, 2012-06-20

The term e Learning is a neologism for CSCL systems that came about during the emergence of website e learning modules From an e learning perspective conventional e learning systems were then based on instructional packets which were delivered to students using assignments Assignments were evaluated by the instructor In contrast the new e learning places increased emphasis on social learning and use of social software such as blogs wikis podcasts and virtual worlds such as Second Life This phenomenon has also been referred to as Long Tail Learning E learning by contrast to e learning systems not based on CSCL assumes that knowledge as meaning and understanding is socially constructed Learning takes place through conversations about content and grounded interaction about problems and actions Advocates of social learning claim that one of the best ways to learn something is to teach it to others However it should be noted that many early online courses such as those developed by Murray Turoff and Starr Roxanne Hiltz in the 1970s and 80s at the New Jersey Institute of Technology courses at the University of Guelph in Canada the British Open University and the online distance courses at the University of British Columbia where Web CT now incorporated into Blackboard Inc was first developed have always made heavy use of online discussion between students Also from the start practitioners such as Harasim in 1995 have put heavy emphasis on the use of learning networks for knowledge construction long before the term e learning let alone CSCL was even considered There is also an increased use of virtual classrooms online presentations delivered live as an online learning platform and classroom for a diverse set of education providers such as Minnesota State Colleges and Universities and Sagem MN School District In addition to virtual classroom environments social networks have become an important part of e learning Social networks have been used to foster online learning communities around subjects as diverse as test preparation and language education Mobile Assisted Language Learning MALL is a term used to describe using handheld computers or cell phones to assist in language learning Some feel however that schools have not caught up with the social networking trends Few traditional educators promote social networking unless they are communicating with their own colleagues DLR Associates consulting group first became interested in e learning modules at the annual Distance Learning Conference held at the University of Maine I decided to offer e learning services since we were already evolved with computer assisted education techniques DLR Associates had been involved with CAE since computers were first used in engineering education It was our hope a trend could be started towards blended learning services where computer based activities were integrated with practical or classroom based situations Dan Ryan Professor Emeritus Clemson University

Computer-Aided Construction of Chemical Kinetic Models ,2014 The combustion chemistry of even simple fuels can be extremely complex involving hundreds or thousands of kinetically significant species The most reasonable way to deal with this complexity is to use a computer not only to numerically solve the kinetic model but also to construct the kinetic model in the first place Because these large models contain so many numerical parameters e g rate coefficients thermochemistry one never has sufficient data to uniquely determine them all experimentally Instead one must work in predictive mode using theoretical rather than experimental values for many of the numbers in the model and as appropriate refining the most sensitive numbers through experiments Predictive chemical kinetics is exactly what is needed for computer aided design of combustion systems based on proposed alternative fuels particularly for early assessment of the value and viability of proposed new fuels before those fuels are commercially available This project was aimed at making accurate predictive chemical kinetics practical this is a challenging goal which requires a range of science advances The project spanned a wide range from quantum chemical calculations on individual molecules and elementary step reactions through the development of improved rate thermo calculation procedures the creation of algorithms and software for constructing and solving kinetic simulations the invention of methods for model reduction while maintaining error control and finally comparisons with

experiment Many of the parameters in the models were derived from quantum chemistry calculations and the models were compared with experimental data measured in our lab or in collaboration with others **Journal of Biological Education**,1985 *Physics Briefs* ,1992 Comprehensive Dissertation Index University Microfilms International,1984
