Handbook of Philosophical Logic Dov M. Gabbay, Franz Guenther, 2013-06-29 It is with great pleasure that we are presenting to the community the second edition of this extraordinary handbook It has been over 15 years since the publication of the first edition and there have been great changes in the landscape of philosophical logic since then The first edition has proved invaluable to generations of students and researchers in formal philosophy and language as well as to consumers of logic in many applied areas The main logic article in the Encyclopaedia Britannica 1999 has described the first edition as the best starting point for exploring any of the topics in logic We are confident that the second edition will prove to be just as good The first edition was the second handbook published for the logic community It followed the North Holland one volume Handbook of Mathematical Logic published in 1977 edited by the late Jon Barwise The four volume Handbook of Philosophical Logic published 1983-1989 came at a fortunate temporal junction at the evolution of logic This was the time when logic was gaining ground in computer science and artificial intelligence circles These areas were under increasing commercial pressure to provide devices which help and/or replace the human in his daily activity This pressure required the use of logic in the modelling of human activity and organisation on the one hand and to provide the theoretical basis for the computer program constructs on the other

First-Order Programming Theories Tamas Gergely, Laszlo Ury, 2012-12-06 This work presents a purely classical first order logical approach to the field of study in theoretical computer science sometimes referred to as the theory of programs or programming theory This field essentially attempts to provide a precise mathematical basis for the common activities involved in reasoning about computer programs and programming languages and it also attempts to find practical applications in the areas of program specification verification and programming language design Many different approaches with different mathematical frameworks have been proposed as a basis for programming theory They differ in the mathematical machinery they use to define and investigate programs and program properties and they also differ in the concepts they deal with to understand the programming paradigm Different approaches use different tools and viewpoints to characterize the data environment of programs Most of the approaches are related to mathematical logic and they provide their own logic These logics however are very eclectic since they use special entities to reflect a special world of programs and also they are usually incomparable with each other This Babel's mess irritated us and we decided to peel off the eclectic components and try to answer all the questions by using classical first order logic

Algol-like Languages Peter O'Hearn, Robert Tennent, 2013-03-14 To construct a compiler for a modern higher level programming language one needs to structure the translation to a machine like intermediate language in a way that reflects the semantics of the language little is said about such structuring in compiler texts that are intended to cover a wide variety of programming languages More is said in the literature on semantics directed compiler construction 1 but here too the viewpoint is very general though limited to 1 languages with a finite number of syntactic types On the other hand there is a considerable body of work using the continuation passing transformation to structure compilers for the specific case of call by value languages such as SCHEME and ML 21 3 In this paper we will describe a method of structuring the translation of ALGOL like languages that is based on the functor category semantics developed by Reynolds 4 and Oles 51 6 An alternative approach using category theory to structure compilers is the early work of F L Morris 7 1 which anticipates our treatment of boolean expressions but does not deal with procedures 2 Types and Syntax An ALGOL like language is a typed lambda calculus with an unusual repertoire of primitive types Throughout most of this paper we assume that the primitive types are comm and integer expression integer accumulator integer variable I and that the set 8 of types is the least set containing these primitive types and closed under the binary operation *Logics of Programs, Workshop, Carnegie Mellon University, Pittsburgh, PA, June 6-8, 1983* Edmund Melson Clarke (Jr.), Dexter Kozen, 1984
