Deep Roots:

Deepest Roots Samuel Livingston, AI, 2025-02-19 *Deepest Roots* explores the hidden world of tree roots revealing their critical role in forest ecology and the survival of entire ecosystems. It dives into how root systems adapt in diverse even hostile environments. One intriguing aspect is how root architecture varies dramatically allowing trees to anchor themselves effectively in different soil types and climates. Furthermore, the book highlights the biomechanics of anchorage explaining how roots withstand immense forces to keep trees upright even during extreme weather. The book progresses from basic root morphology to biomechanical principles and then to adaptive strategies in extreme environments ultimately discussing practical applications for conservation. It emphasizes the importance of understanding plant adaptation especially as climate change intensifies and provides insights into how root systems contribute to carbon sequestration and nutrient cycling. This perspective is vital for informing sustainable forestry practices and mitigating the impacts of climate change on forest health making the book a valuable resource for anyone interested in nature biology and environmental science. **Crop**

Physiology Case Histories for Major Crops Victor Sadras, Daniel Calderini, 2020-12-05 *Crop Physiology Case Histories of Major Crops* updates the physiology of broad acre crops with a focus on the genetic environmental and management drivers of development capture and efficiency in the use of radiation water and nutrients the formation of yield and aspects of quality. These physiological processes are presented in a double context of challenges and solutions. The challenges to increase plant based food fodder fiber and energy against the backdrop of population increase climate change dietary choices and declining public funding for research and development in agriculture are unprecedented and urgent. The proximal technological solutions to these challenges are genetic improvement and agronomy. Hence the premise of the book is that crop physiology is most valuable when it engages meaningfully with breeding and agronomy. With contributions from 92 leading scientists from around the world each chapter deals with a crop maize rice wheat barley sorghum and oat quinoa soybean field pea chickpea peanut common bean lentil lupin and faba bean sunflower and canola potato cassava sugar beet and sugarcane and cotton. A crop based approach to crop physiology in a G x E x M context. Captures the perspectives of global experts on 22 crops.
