Complex Analytic Geometry Of Complex Parallelizable Manifolds:

Complex Analytic Geometry of Complex Parallelizable Manifolds Jörg Winkelmann, 1998 **An Alternative Approach to Lie Groups and Geometric Structures** Ercüment H. Ortaçgil, 2018-06-28 This book presents a new and innovative approach to Lie groups and differential geometry Rather than compiling and reviewing the existing material on this classical subject Professor Orta gil instead questions the foundations of the subject and proposes a new direction Aimed at the curious and courageous mathematician this book aims to provoke further debate and inspire further development of this original research

Annales de l'Institut Fourier, 2001 [Number Fields and Function Fields - Two Parallel Worlds](#) Gerard van der Geer, B.J.J Moonen, René Schoof, 2005-09-14 Invited articles by leading researchers explore various aspects of the parallel worlds of function fields and number fields Topics range from Arakelov geometry the search for a theory of varieties over the field with one element via Eisenstein series to Drinfeld modules and motives Aimed at graduate students mathematicians and researchers interested in geometry and arithmetic and their connections

Boundary Cohomology of Shimura Varieties, III Michael Harris, Steven Zucker, 2001 In this book the authors complete the verification of the following fact The nerve spectral sequence for the cohomology of the Borel Serre boundary of a Shimura variety Sh is a spectral sequence of mixed Hodge de Rham structures over the field of definition of its canonical model To achieve that they develop the machinery of automorphic vector bundles on mixed Shimura varieties for the latter enter in the boundary of the toroidal compactifications of Sh and study the nerve spectral sequence for the automorphic vector bundles and the toroidal boundary They also extend the technique of averting issues of base change by

taking cohomology with growth conditions They give and apply formulas for the Hodge gradation of the cohomology of both \mathbb{S}^1 and its Borel Serre boundary *Ordered Algebraic Structures and Related Topics* Fabrizio Broglia, 2017

Contains the proceedings of the international conference Ordered Algebraic Structures and Related Topics held in October 2015 at CIRM Luminy Marseilles Papers cover topics in real analytic geometry real algebra and real algebraic geometry including complexity issues model theory of various algebraic and differential structures Witt equivalence of fields and the moment problem *Nagoya Mathematical Journal*, 2004

The Wave Diffracted by a Wedge with Mixed Boundary Conditions Olivier Lafitte, 2002 This monograph studies the diffraction of a wave by a curved wedge on the plane in the case where each side of the wedge is characterized by a mixed boundary condition of impedance type This book is suitable for graduate students and researchers interested in partial differential equations in particular in diffraction theory and its applications to problems in physics **Spectral Properties of Self-similar Lattices and Iteration of Rational Maps**

Christophe Sabot, 2003 In this text the author considers discrete Laplace operators defined on lattices based on finitely ramified self similar sets and their continuous analogs defined on the self similar sets He focuses on the spectral properties of these operators The basic example is the lattice based on the Sierpinski gasket He introduces a new renormalization map that appears to be a rational map defined on a smooth projective variety More precisely this variety is isomorphic to a product of three types of Grassmannians complex Grassmannians Lagrangian Grassmannian and orthogonal Grassmannians He relates some characteristics of the dynamics of its iterates with some characteristics of the spectrum of the operator Specifically he gives an explicit formula for the density of states in terms of the Green current of the map and he relates the indeterminacy points of the map with the so called Neumann Dirichlet eigenvalues which lead to eigenfunctions with compact support on the unbounded lattice Depending on the asymptotic degree of the map he can prove drastically different spectral properties of the operators The formalism is valid for the general class of finitely ramified self similar sets

Mathematical Study of the Betaplane Model Isabelle Gallagher, Laure Saint-Raymond, 2006 The authors are interested in a model of rotating fluids describing the motion of the ocean in the equatorial zone This model is known as the Saint Venant or shallow water type system to which a rotation term is added whose amplitude is linear with respect to the latitude in particular it vanishes at the equator After a physical introduction to the model the authors describe the various waves involved and study in detail the resonances associated to those waves They then exhibit the formal limit system as the rotation becomes large obtained as usual by filtering out the waves and prove its wellposedness Finally they prove three types of convergence results a weak convergence result towards a linear geostrophic equation a strong convergence result of the filtered solutions towards the unique strong solution to the limit system and a hybrid strong convergence result of the filtered solutions towards a weak solution to the limit system In particular the authors obtain that there are no confined equatorial waves in the mean motion as the rotation becomes large *On Mapping Properties of the General Relativistic*

Constraints Operator in Weighted Function Spaces, with Applications Piotr T. Chruściel, Erwann Delay, 2003 In this book the authors prove perturbation and gluing results for solutions of the general relativistic constraints with controlled boundary behavior or asymptotic behavior This is obtained by a study of the linearized equation in weighted spaces à la Corvino Schoen Among other methods this can be used to prove existence of non trivial asymptotically simple vacuum space times The book is suitable for graduate students and research mathematicians interested in analysis

Global Solutions for Small Nonlinear Long Range Perturbations of Two Dimensional Schrödinger Equations Jean-Marc Delort, 2002 Here the author presents the following Let Q_1, Q_2 be two quadratic forms and u a local solution of the two dimensional Schrödinger equation $i \partial_t \Delta u + Q_1 u + \nabla_x u + Q_2 \bar{u} + \nabla_x \bar{u}$ He proves that if Q_1 and Q_2 do depend on the derivatives of u and if the Cauchy datum is small enough and decaying enough at infinity the solution exists for all times The difficulty of the problem originates in the fact that the nonlinear perturbation is a long range one This means that it can be written as the product of a derivative of u and of a potential whose L^∞ space norm is not time integrable at infinity

Encyclopaedia of Mathematics Michiel Hazewinkel, 2013-12-01 This ENCYCLOPAEDIA OF MATHEMATICS aims to be a reference work for all parts of mathematics It is a translation with updates and editorial comments of the Soviet Mathematical Encyclopaedia published by Soviet Encyclopaedia Publishing House in five volumes in 1977-1985 The annotated translation consists of ten volumes including a special index volume There are three kinds of articles in this ENCYCLOPAEDIA First of all there are survey type articles dealing with the various main directions in mathematics where a rather fine subdivision has been used The main requirement for these articles has been that they should give a reasonably complete up to date account of the current state of affairs in these areas and that they should be maximally accessible On the whole these articles should be understandable to mathematics students in their first specialization years to graduates from other mathematical areas and depending on the specific subject to specialists in other domains of science engineers and teachers of mathematics These articles treat their material at a fairly general level and aim to give an idea of the kind of problems techniques and concepts involved in the area in question They also contain background and motivation rather than precise statements of precise theorems with detailed definitions and technical details on how to carry out proofs and constructions The second kind of article of medium length contains more detailed concrete problems results and techniques

Coefficient Systems and Supersingular Representations of $GL_2(F)$ Vytautas Paskunas, 2004 Let F be a non Archimedean local field with the residual characteristic p The author constructs a good number of smooth irreducible overline \mathbf{F}_p representations of $\mathrm{GL}_2(F)$ which are supersingular in the sense of Barthel and Livné If $F \cong \mathbf{Q}_p$ then results of Breuil imply that our construction gives all the supersingular representations up to the twist by an unramified quasi character The author conjectures that this is true for an arbitrary F The book is suitable for graduate students and research mathematicians interested in algebra and algebraic geometry

Mémoire, 2006 Mathematical

Reviews ,2001 *Strichartz Estimates for Schrödinger Equations with Variable Coefficients* Luc Robbiano, Claude Zuily,2005 The authors prove the local in time Strichartz estimates for the full range of parameters given by the scaling unless the end point for asymptotically flat and non trapping perturbations of the flat Laplacian in \mathbb{R}^n $n \geq 2$ The main point of the proof namely the dispersion estimate is obtained in constructing a parametrix The main tool for this construction is the use of the Fourier Bros Iagolnitzer FBI transform *Bulletin de la Société mathématique de France* ,2006 **On Sums of Sixteen Biquadrates** Jean-Marc Deshouillers, Koichi Kawada, Trevor D. Wooley,2005 By 1939 it was known that 13 792 cannot be expressed as a sum of sixteen biquadrates folklore that there exist infinitely many natural numbers which cannot be written as sums of fifteen biquadrates Kempner and that every sufficiently large integer is a sum of sixteen biquadrates Davenport In this memoir it is shown that every integer larger than 10 216 and not divisible by 16 can be represented as a sum of sixteen biquadrates Combined with a numerical study by Deshouillers Hennecart and Landreau this result implies that every integer larger than 13 792 is a sum of sixteen biquadrates The volume is suitable for graduate students and research mathematicians interested in number theory
