## Arithmetic Functions And Integer Products:

**Arithmetic Functions and Integer Products** P.D.T.A. Elliott, 2012-12-06 Every positive integer  $m$  has a product representation of the form  $m = \prod_{k=1}^{\infty} p_k^{n_k}$  where  $p_k$  and the  $n_k$  are positive integers and each  $E_i$  is a value that can be given for  $v$  which is uniform in the  $m$ . A representation can be computed so that no  $n_i$  exceeds a certain fixed power of  $2^m$  and the number  $k$  of terms needed does not exceed a fixed power of  $\log 2^m$ . Consider next the collection of finite probability spaces whose associated measures assume only rational values. Let  $h(x)$  be a real valued function which measures the information in an event depending only upon the probability  $x$  with which that event occurs. Assuming  $h(x)$  to be non negative and to satisfy certain standard properties it must have the form  $A x \log x + B x + C$ . Except for a renormalization this is the well known function of Shannon. What do these results have in common? They both apply the theory of arithmetic functions. The two widest classes of arithmetic functions are the real valued additive and the complex valued multiplicative functions. Beginning in the thirties of this century the work of Erdős, Kac, Kubilius, Turán and others gave a discipline to the study of the general value distribution of arithmetic functions by the introduction of ideas, methods and results from the theory of Probability. I gave an account of the resulting extensive and still developing branch of Number Theory in volumes 239-240 of this series under the title *Probabilistic Number Theory*.

*Number Theory, Analysis, and Combinatorics* János Pintz, András Biró, Kálmán Györy, Gergely Harcos, Miklós Simonovits, József Szabados, 2013-12-12 Paul Turán one of the greatest Hungarian mathematicians was born 100 years ago on August 18 1910. To celebrate this occasion the Hungarian Academy of Sciences, the Alfred Rényi Institute of Mathematics, the János Bolyai Mathematical Society and the Mathematical Institute of Eötvös Loránd University organized an international conference devoted to Paul Turán's main areas of interest: number theory, selected branches of analysis and selected branches of combinatorics. The conference was held in Budapest August 22-26 2011. Some of the invited lectures reviewed different aspects of Paul Turán's work and influence. Most of the lectures allowed participants to report about their own work in the above mentioned areas of mathematics.
