Architecture-independent Loop Parallelisation:

Architecture-Independent Loop Parallelisation Radu C. Calinescu,2012-12-06 Architecture independent programming and automatic parallelisation have long been regarded as two different means of alleviating the prohibitive costs of parallel software development Building on recent advances in both areas Architecture Independent Loop Parallelisation proposes a unified approach to the parallelisation of scientific computing code This novel approach is based on the bulk synchronous parallel model of computation and succeeds in automatically generating parallel code that is architecture independent scalable and of analytically predictable performance

Algorithms and Architectures for Parallel Processing Sang-Soo Yeo,Jong Hyuk Park,Laurence Tianruo Yang,Ching-Hsien Hsu,2010-05-29 It is our great pleasure to welcome you to the proceedings of the 10th annual event of the International Conference on Algorithms and Architectures for Parallel Processing ICA3PP ICA3PP is recognized as the main regular event covering the many dimensions of parallel algorithms and architectures encompassing fundamental theoretical approaches practical experimental projects and commercial components and systems As applications of computing systems have permeated every aspect of daily life the power of computing systems has become increasingly critical Therefore ICA3PP 2010 aimed to permit researchers and practitioners from industry to exchange information regarding advancements in the state of the art and practice of IT driven services and applications as well as to identify emerging research topics and define the future directions of parallel processing We received a total of 157 submissions this year showing by both quantity and quality that ICA3PP is a premier conference on parallel processing In the first stage all papers submitted were screened for their relevance and general submission requirements These manuscripts then underwent a rigorous peer review process with at least three reviewers per paper In the end 47 papers were accepted for presentation and included in the main proceedings comprising a 30% acceptance rate

Parallel Computing in Science and Engineering Rüdiger Dierstein,Dieter Müller-Wichards,Hans-Martin Wacker,1988-05-11 It was the aim of the conference to present issues in parallel computing to a community of potential engineering scientific users An overview of the state of the art in several important research areas is given by leading scientists in their field The classification question is taken up at various points ranging from parametric characterizations communication structure and memory distribution to control and execution schemes Central issues in multiprocessing hardware and operation such as scalability techniques of overcoming memory latency and synchronization overhead as well as fault tolerance of communication networks are discussed The problem of designing and debugging parallel programs in a user friendly environment is addressed and a number of program transformations for enhancing vectorization and parallelization in a variety of program situations are described Two different algorithmic techniques for the solution of certain classes of partial differential equations are discussed The properties of domain decomposition algorithms and their mapping onto a CRAY XMP type architecture are investigated and an overview is given of the merit of various approaches to

exploiting the acceleration potential of multigrid methods Finally an abstract performance modeling technique for the behavior of applications on parallel and vector architectures is described *Parallel Processing Architectures and VLSI Hardware* Angel L. Gao,Gabriel M. Silberman,1994 Fine and medium grain parallelism continues to hold its own as a vital vibrant research topic Within the area new developments in superscalar and VLIW architectures and their associated compilation techniques have provided exciting new avenues to extract performance from a slowing technology curve Comprising 28 full length papers and a number of short poster papers this publication offers a high quality exploration of the current state of the art in the field It will be of particular interest to those involved in control structures and microprogramming processor architectures computer system implementation programming techniques and software engineering *Aspects of Computation on Asynchronous Parallel Processors* Margaret H. Wright,1989 The increasing availability of asynchronous parallel processors has provided opportunities for original and useful work in scientific computing However the field of parallel computing is still in a highly volatile state and researchers display a wide range of opinion about many fundamental questions such as models of parallelism approaches for detecting and analyzing parallelism of algorithms and tools that allow software developers and users to make effective use of diverse forms of complex hardware This volume collects the work of researchers specializing in different aspects of parallel computing who met to discuss the framework and the mechanics of numerical computing The far reaching impact of high performance asynchronous systems is reflected in the wide variety of topics which include scientific applications e g linear algebra lattice gauge simulation ordinary and partial differential equations models of parallelism parallel language features task scheduling automatic parallelization techniques tools for algorithm development in parallel environments and system design issues *Parallel Language Constructs for Tensor Product Computations on Loosely Coupled Architectures* Institute for Computer Applications in Science and Engineering,1989 *Parallel Architectures and Compilation Techniques* ,1997 **Parallel Loop Transformation Techniques for Vector-based Multiprocessor Systems** Viet Nhu Ngo,1994 **Architectures and Compilation Techniques for Fine and Medium Grain Parallelism** Michel Cosnard,Kemal Ebcioğlu,Jean-Luc Gaudiot,1993 Medium and especially fine grain parallelism has been a focus of the data research area since its inception in the 1970 s Much experience has been gained but the interest both in the academia and the industry continues to flourish The development of multiple ALU superscalars superpipelined machines VLIWs small resources Von Neumann machines has meant the related software and hardware topics for finding higher degrees of fine and medium grain parallelism on such machines has become increasingly important This volume presents new parallelization ideas being discovered in this

relatively unchartered research area including some which are likely to have immediate practical impact With invited papers from prominent specialists it is hoped it also offers a critical review of the accomplishments of the data flow research area to date
