

A Brief History of Russian Flying Helmets and Aviator Oxygen Masks

By Christopher T. Carey

Some general background:

For over fifty years, factual information on a wealth of details concerning Russian military materiel and systems was successfully obscured behind a tight blanket of state-imposed security. Attributable to polar economic philosophies characterising the clash between America's system of capitalistic democracy and the Soviet Union's form of state-sponsored (Communist) socialism (during the culminating expression of that super power contention that was 'The Cold War' of the 50s, 60s, and 70s), it was not until the crushing financial burden of this competition resulted in the downfall of the Soviet State that valid information concerning many of the Russian developments in military materiel was finally revealed.

Areas of particular interest to Western military historians that were kept carefully hidden included Soviet space systems and hardware design efforts, advances in submarine and undersea weapons systems (e.g. nuclear missile submarines), and improved aviation life support/egress systems development and aircrew survival hardware.

Partly owing to the consequent extreme difficulty associated with gaining understanding of Russian military systems [note: the use of the word 'Russia' will hereafter suffice to represent both the post 1991 Russian Republic and the former Soviet Union for our present purposes], and partly attributable to the popular Western sport of 'Russia bashing' (i.e. automatic denigration and dismissal of anything produced by Russia's defense science as technologically inferior) that was politically in vogue during the Cold War period, little serious thought and analysis was dedicated towards more objective understanding of Russian advancements in aerospace egress and life support science. (For our purposes here, one may think of egress in terms of aircraft emergency ejection seat systems, and of *life support* as aircrew personal equipment such as oxygen breathing systems, protective helmets, and survival gear.)

Only in the past 10 years has it become clear that the ejection seat systems used in Russian aircraft are not just theoretically highly advanced, but that they function extremely well in saving the lives of Russian pilots ejecting from their crippled aircraft. Not surprisingly, the same high standards of technological development are
