**Dissipative Structures in Transport Processes and Combustion** Dirk Meinköhn,2012-07-24 Any description of the workings of nature by means of measurements and observations is beset with the problem of how to cope with an immense amount of information In physics it is an established approach to derive basic equations which then serve as cornerstones of what is called a theory of the phenomena This derivation is based on certain characteristics of the phenomena the refinement of which results from a reduction of the amount of empirical information with the reduction leading to an enhancement of the very characteristics that are sought for in the otherwise seemingly amorphous wealth of data If physics is mainly concerned with the derivation of equations lately there has emerged a conceptually different approach which in a way is equivalent to a reversal of the line of attack here the basic equations serve as the point of departure and the aim is to demonstrate that the equations are capable of representing the essence of the describing certain characteristics which are thought phenomenon under investigation By definition this variant approach must transcend the realm of pure physics and could possibly be termed applied mathematics in a broader sense The phenomena it strives to characterize arise from a range of influences such that a combination of theoretical concepts from physics chemistry engineering biology etc is called for

**Nonlinear Nonequilibrium Thermodynamics II** Rouslan L. Stratonovich,1994-05-16 This two volume work gives the first detailed coherent treatment of a relatively young branch of statistical physics nonlinear nonequilibrium and fluctuational dissipative thermodynamics This area of research has taken shape rather recently its development began in 1959 The earlier

theory linear nonequilibrium thermodynamics is in principle a simple special case of the new theory Despite the fact that the title of the book includes the word nonlinear it also covers the results of linear nonequilibrium thermodynamics The presentation of the linear and nonlinear theories is done within a common theoretical framework that is not subject to the linearity condition The author hopes that the reader will perceive the intrinsic unity of this discipline the uniformity and generality of its constituent parts This theory has a wide variety of applications in various domains of physics and physical chemistry enabling one to calculate thermal fluctuations in various nonlinear systems The book is divided into two volumes Fluctuation dissipation theorems or relations of various types linear quadratic and cubic classical and quantum are considered in the first volume There one encounters the Markov and non Markov fluctuation dissipation theorems FDTs theorems of the first second and third kinds Nonlinear FDTs are less known than their linear counterparts The present second volume of the book deals with the advanced theory It consists of four chapters The connection and interdependence of the material in the various chapters of both volumes are illustrated in the accompanying diagram

**Self-organization in Optical Systems and Applications in Information Technology** Mikhail Alekseevich Vorontsov, Walter Blaine Miller, 1995 Contrary to monographs on non linear optics this book concentrates on problems of self organization in various important contexts The reader learns how patterns in non linear optical systems are created and what theoretical methods can be applied to describe them Next various aspects of pattern formation such as associative memory information processing spatio temporal instability photo refraction and so on are treated The book addresses graduate students and researchers in physics and optical engineering

自组织系统 (Japan),1900      **Self-Organizing Systems** F.Eugene Yates,2012-12-06 Technological systems become organized by commands from outside as when human intentions lead to the building of structures or machines But many natural systems become structured by their own internal processes these are the self organizing systems and the emergence of order within them is a complex phenomenon that intrigues scientists from all disciplines Unfortunately complexity is ill defined Global explanatory constructs such as cybernetics or general systems theory which were intended to cope with complexity produced instead a grandiosity that has now mercifully run its course and died Most of us have become wary of proposals for an integrated systems approach to complex matters yet we must come to grips with complexity somehow Now is a good time to reexamine complex systems to determine whether or not various scientific specialties can discover common principles or properties in them If they do then a fresh multidisciplinary attack on the difficulties would be a valid scientific task Believing that complexity is a proper scientific issue and that self organizing systems are the foremost example R Tomovic Z Damjanovic and I arranged a conference August 26 September 1 1979 in Dubrovnik Yugoslavia to address self organizing systems We invited 30 participants from seven countries Included were biologists geologists physicists chemists mathematicians biophysicists and control engineers Participants were asked not to bring manuscripts but rather to present positions on an assigned topic Any writing would be done after the conference when the writers could benefit from their experiences there

*Quantum Signatures of Chaos* Fritz Haake,1991 This textbook provides an excellent introduction to a new and rapidly developing field of research The topics treated include a detailed exploration of the quantum aspects of nonlinear dynamics quantum criteria to distinguish regular and irregular motion antiunitary symmetries generalized time reversal and a thorough account of the quantum mechanics of dissipative systems Each chapter is accompanied by a selection of problems which will help the student to test and deepen his/her understanding and to acquire an active command of the methods The second edition is significantly expanded Of the considerable theoretical progress lately achieved the book focusses on the deeper statistical exploitation of level dynamics improved control of semiclassical periodic orbit expansions and superanalytic techniques for dealing with various types of random matrices

Gardiner,1991      Complex Systems ,1991      Overviews Of Recent Research On Energetic Materials Donald L Thompson,Robert W Shaw,Thomas B Brill,2005-08-02 Few books cover experimental and theoretical methods to characterize decomposition combustion and detonation of energetic materials This volume by internationally known and major contributors to the field is unique because it summarizes the most important recent work what we know with confidence and what main areas remain to be investigated Most chapters comprise summaries of work spanning decades and contain expert commentary available nowhere else Although energetic materials are its focus this book provides a guide to modern methods for investigations of condensed and gas phase reactions Although these energetic reactions are complex and difficult to study the work discussed here provides readers with a substantial understanding of the behavior of materials now in use and a
